Any story of the actual production of a practical, commercial, incandescent lamp would hardly be complete unless we pay our respects to the Encyclopedia Britannica. According to a story appearing in the *New York World* of September 15, 1929, this venerable publication calls Swan the inventor of the incandescent lamp, saying: "So far back as 1860 he constructed an electric lamp with a carbon filament, which was formed by packing pieces of paper or card with charcoal powder in a crucible and subjecting the whole to a high temperature. The carbonized paper thus obtained he mounted in the form of a fine strip in a vacuous glass vessel and connected it with a battery of Grove's cells, which though not strong enough to raise it to complete incandescence, were sufficient to make it red-hot.

"This was substantially the method adopted by Edison nearly twenty years later, after various fruitless efforts to make a practical lamp with a filament of platinum or a platinum alloy had convinced him of the unsuitability of that metal for the purpose—a conclusion which Swan reasoned out for himself many years before.

"By the time Edison had hit upon the idea of carbonizing paper or bamboo by heat to form the filament, Swan had devised the further improvement of using cotton thread 'parchmentized' by the action of sulphuric acid, and it was by the aid of such carbon filaments that on the 20th of October, 1880, he gave at Newcastle the first public exhibition of a large scale of electric lighting by means of glow lamps."

In view of the well-documented and authentic history of the incandescent lamp, the claim of priority for Swan is, of course, absurd.

There have been other claims from other countries with regard to the invention of the first incandescent lamp. The Electric-Technic Society of Hanover, Germany, for example, has recently unveiled a tablet to Heinrich Goebel as having invented the incandescent lamp some twenty-five years before the Edison patent was filed.

The Goebel claims were the cause of much litigation some thirty years ago and the case was finally settled by District Judge Colt in the Massachusetts Circuit Court in February, 1898. Reciting the history of the art out of which the incandescent lamp emerged, Judge Colt said: "To sub-divide the electric light and embody it in a cheap and durable domestic lamp, capable of successfully competing with gas, had for years baffled the science and skill of the most eminent electricians of this country and in Europe. The difficulty lay in the practical construction of a durable incandescent lamp, rather than in a knowledge of the elements which should compose such a structure.

"Carbon burners, platinum wires, exhausted glass receivers, were old and well known as early as 1845. Starr suggested in the King patent a lamp composed of a thin pencil of carbon, inclosed in a Torricellian vacuum; and Roberts in 1852 proposed to cement the nick of the glass globe into a metallic cup, and to provide it with a tube for exhaustion by means of a hand pump.

"Later, Lodvguine and others provided their lamps with several short carbon pencils, which were successfully brought into circuit as the pencils were consumed, also various devices for perfecting the joints between the metal base and the glass globe, while Sawyer and Man, in 1878, made the bottom plate of glass instead of metal, and charged the lamp with an atmosphere of nitrogen gas, to avoid destruction of the burner from oxidization. In his 1879 lamp, Edison used a platinum burner, which proved a failure, because the platinum melted near the point of incandescence."

Views of leading electrical experts in Europe were then quoted by the Court as being dubious that the problem of division of the electric light would ever be accomplished. Edison, however, persisted in his experiments, evolving the platinum model, in 1879, which was a failure but from which he developed later in that year the final model which was patented in January, 1880.

According to the Court, Heinrich Goebel's story runs thus: "He came to this country from Germany in 1849. * * * He learned to make the arc lamp, and he believed that an incandescent lamp could be produced by a small continuous carbon inclosed in an exhausted glass tube hermetically sealed. He also became familiar with the use of the common air pump, the blowpipe, the method of producing the Torricellian vacuum and the making of carbon conductors."

Then follows a description of Goebel's alleged experiments in New York with arc lamps, which led him to the incandescent type. His affidavit said that he constructed three types of such lamps between the years 1850 and 1872. He used one to illuminate a clock in his home and another on a wagon carrying a telescope, which he exhibited. The first type consisted of an exhausted glass tube, with leading in wires sealed into the inclosing chamber by fusion of the glass.

This model, together with two subsequent ones, were shown at his Monroe Street home. A fourth and much improved type of lamp, exhibited in the court action, was not disclosed to the neighbors and friends, whose testimonies supported Goebel's contentions.

"In the further support of the Goebel anticipation," said the court, "several experts give affidavits to the effect that the Goebel lamp, assuming that it was made prior to 1879, contains the broad invention covered by the second claim of the Edison patents, as it embodied the same combinations of a carbon filament with an all glass exhausted receiver and conductors passing through the glass."

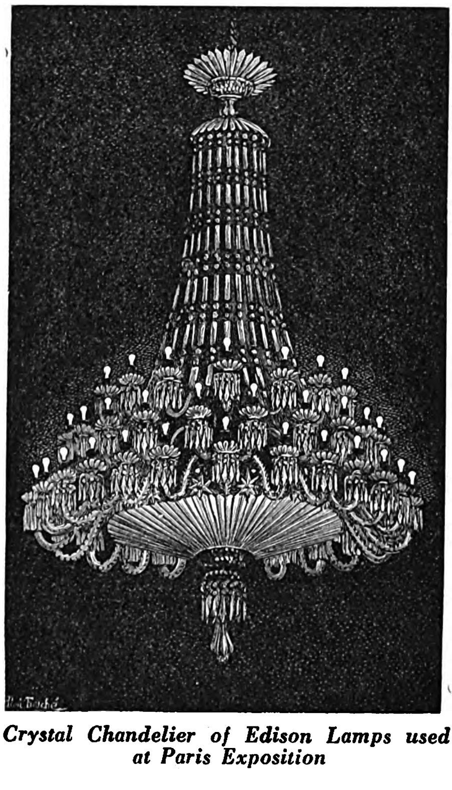
These experts further contend that the Goebel lamps had been operative and practical as lights. To refute these statements, the Edison Company submitted that the "history of the invention and the prior state of the art" did not justify the Goebel claims. Experts contended that the lamps, called exhibits 1, 2 and 3, "could not have been useful for ordinary lighting purposes and were never a practically operative light."

In rendering his decision, Judge Colt said:

"Whether Goebel made the fiddle-bow lamps 1, 2 and 3 is not necessary to determine. The weight of evidence on this motion is in the direction that he made this lamp or lamps similar in general appearance, though it is manifest that few, if any, of the many witnesses who saw the Goebel lamp could form an accurate judgment of the size of the filament or burner. But assuming they were made, they do not anticipate the invention of Edison.

"At most they were experimental toys used to advertise his telescope, or to flash a light upon his clock. . . . They were crudely constructed—their life was brief. They could not be used for domestic purposes. They were in no proper sense the practical commercial lamp of Edison. The literature of the art is full of better lamps, all of which are held to anticipate the Edison patent."[5]

This, apparently, disposes of the German claims, effectually. As a matter of fact, the Goebel lamp was an "experimental toy" and "in no proper sense the practical commercial lamp of Edison."



Crystal Chandelier of Edison Lamps used at Paris Exposition

Exactly the same thing can be said about the incandescent lamps devised by scores of inventors. This statement does not take away from them any of the credit which is due, because every experimentor must have made some contribution to the sum total of knowledge about artificial lighting by incandescence and consequently must have some claim on having contributed to the final result. The fact still remains that the Edison lamp was the first commercially practical lamp and the first to be patented and demonstrated to the public.

It may seem that because I have stressed the phrase "first commercially practical incandescent lamp" that I have set out to prove only that Edison was the real inventor of this lamp. This is not actually the case. What I have tried to justify is the celebration of "Light's Golden Jubilee" in 1929 as the fiftieth anniversary of the birth of incandescent lighting and in honor of Thomas A. Edison. The lamp itself was only one and, perhaps, a relatively unimportant factor, in the solution of the problems involved in this new type of lighting. Even before he had solved the problem of a practical lamp Edison recognized other and more difficult problems before the lamp would be very much more than the many "toys" which had preceded it.

He had to invent many things other than a practical lamp before he could claim to have produced a commercially practicable system of lighting with electricity. First he had to conceive and devise a satisfactory method of distributing electric current to houses, stores and factories. Then he had to invent his lamp. Following this he had to devise a meter so that the company furnishing the electricity could tell just how much current each customer had used. Then he had to devise a means of maintaining an even "pressure" of current so that the customer furthest away from the plant would receive the same amount of light as the customer near the plant, just as the customer of a gas company receives the same amount of gas, no matter how close or how far away he may be from the gas plant. Following this he had to design efficient dynamos, or generating machines, and means for regulating them. Finally he had to invent all sorts of things, such as switches for turning the current on and off, lamp holders, fixtures and the like; also means and methods for wiring houses.

In other words, Edison had to really invent a whole new system of artificial lighting, from the means of generating and distributing the current to the actual lamp and means for controlling it. Without *all* of these things, even his successful incandescent lamp would have been little more than an interesting experiment.

Constructively Iconoclastic or—Iconoclastically Constructive?

By AMPLIFIER

PERSONALLY, I think that is a great title for a piece. I know exactly what I mean, although I am not at all sure that college professors or purists (I am told there are such animals) will interpret it the way I do. But anyhow I think it is a swell title indicating culture, erudition and what-not on the part of the author. Furthermore, it was suggested by a friend of mine who is erudite beyond description, although it has been said that he is headed for the place so well advertised by the publicist Dante. He is so erudite that he keeps on his desk an old-fashioned salt shaker full of commas which he scatters all over any manuscript turning up in his office whether or not he has any legal, moral or educational right to touch it. Incidentally, he claims he is a "purist," but I doubt if he knows what a purist is—I think he got the word from a friend of his who is in the printing game and who sells him stuff by catering to his erudite complex.

Turning to Funk & Wagnalls College Standard Dictionary—if it must be known, everyone even remotely connected with the light and power industry is a college man and swears by Funk & Wagnalls because they publish the *Literary Digest*—I find that about the best definition of "Iconoclast" is "destroyer of images." There are a lot of vitamines in that definition with which to feed our mental processes while watching the world go by.

ASSUMING this definition to be correct—and who am I to question a College Dictionary?—then being an iconoclast is just being common. Intelligent perusal of the daily papers proves almost conclusively that there are more "destroyers of images" in the United States than there are makers of images. They seem to be all over the lot, and for some reason or other they manage to keep on the front pages of the newspapers most successfully.

I have no quarrel with the new order of things, recognizing that progress demands the upsetting, or tearing down, of the old and the substitution of the new therefor. It is all in the manner of approach.

It appears to me that much of the trouble with would be reformers is that they approach the subject blindly, thrashing about like a bull in a china shop, with no idea or regard for the damage being caused. Others there be, however, who approach a subject with the goal just as definitely in mind, but with a constructive thought of destroying as little as possible and at the same time building toward that goal.

These two groups I therefore segregate into the iconoclastically constructive, or those who tear down ruthlessly in order to construct, but without a definite idea of what the final result will be, and the constructively iconoclastic, who build up a sentiment, or a belief, in order to have something tangible as a substitution for the image they are aiming to eventually destroy.

Take the question of temperance. Not so very many years ago the progress which was being made by various individuals and organizations, operating on a local, State or nation-wide basis and engaged in selling the idea that temperance, with particular regard to alcoholic drinks, was the part of expediency and discretion, persuaded a lot of us that, after all, America is a temperate nation and inclined to listen to words of wisdom. Regardless of the fact that we, as individuals, may or may not have patronized them, the corner saloon loomed up as something of a growing menace, and even the least temperance-minded of us welcomed the idea of fewer but better saloons.

THEN along came prohibition and its supporters. The more fanatical set abou to destroy the image which had been set up. The United States of America, was, and is, a nation of drunkards, they said, and something must be done about it at once. And so our iconoclasts of the creed that only salutary laws will keep a people in order, set about to cram down people's throats a kill or cure prescription, when the milder dose of the real temperance homeopaths was quietly eliminating the disease of alcoholic intemperance, wherever it might exist, by the simple method of appealing to the intelligence.

Undoubtedly most of these people are sincere, although it might be suggested that the issue provides some of them with excellent livings. They wash out one of the fundamental principles on which our alleged government "of the people, for the people and by the people" is founded, and stand unashamed as iconoclasts—"destroyers of images" such as liberty and the inherent decency of the American people—basing their right to practice their particular form of iconoclasm on the theory that it is constructive. They are, I would say, iconoclastic constructively and not, by any means, constructively iconoclastic. As a matter of fact, they are not at all constructive.

Or, suppose we take the question of clothes. Self-appointed conservators of public morals have been thundering about the fact that the ladies persist in running about the streets in little more than their birthday clothes. Then along comes Bernard Shaw, who is nothing if he is not constructively iconoclastic, and tells us that clothes make for sex appeal, while nudity banishes it. But will these folks believe him? Will they realize the fact that it is only the men who wear clothes and that men are not supposed to have any sex appeal, dressed or undressed? They will not. They can be expected to start a campaign to take the clothes off the men and put them on the women, thus eliminating sex appeal with quite the same degree of success as others have eliminated the drinking of intoxicating liquor.

Suppose we look at the question of "lobbying," which seems to be occupying a deal of valuable space in the newspapers just at present. If we are to discuss the question intelligently, we must first understand what a lobby, or a lobbyist, or lobbyism is. Then we must know who are, and who are not, lobbyists. Therefore, the only thing to do is to turn once more to the good old college dictionary. Here we find that lobbying is "to try to carry (a bill) through a legislative body by outside influence." That is not a very satisfactory definition. My understanding of "lobbying" is that it is the profession of influencing legislation, and may take the form of trying to prevent the passage of a bill, or the alteration of the phraseology or intent of a bill, as well as an attempt to get a bill passed.

IF my interpretation is correct, then almost every intelligent person is a lobbyist; every editorial writer in the United States must be a lobbyist. Editorial writers are much given to trying to influence legislation by explaining to legislators, whether State or national, just what they should do with regard to a particular legislative project; and most certainly editorial advice is "an outside influence." Every individual business man who talks to the representative of his district, the United States Senator from his State, or a member of the State Legislature about pending legislation, is a lobbyist. Every industrial organization, every chamber of commerce, every organization of any kind, whatsoever its purpose may be, is engaged in lobbying if it dares even to express an opinion which may eventually get to anyone who may be engaged in making the laws of the nation and disturb the pristine purity of the atmosphere in which a certain type of iconoclast insists that they exist.

Turning to a rather stupendous and somewhat depressing work entitled "Group Representation Before Congress," published by "The Institute for Government Research of the Brookings Institute," we find that more than 500 "groups" have representatives in Washington. "An observer on the scene," says this report, "states that there are certainly more than a thousand representatives of organized groups in Washington, and probably nearly five thousand, if their clerks, aids, statisticians, publicity helpers, and others be included. This takes no account of the volunteer spokesmen that come to Washington from time to time to impress their views upon officials of the government."

WITHOUT doubt, lobbying is a national institution, and the question arises as to what to do about it and as to whether or not anything should be done about it. One prominent senator has lamented: "They (the lobbyists) are becoming as numerous as the lice of Egypt. A stone casually thrown in the streets of the city would probably hit half a dozen of them." Another senator has stated: "I have seen the corridors leading to the Finance Committee room of the Senate so filled with them that it was almost impossible for an outside senator to get to the committee room, and barely possible to get into it." Still another senator said on one occasion: "It is reaching a point nowadays where Congress is swarming with lobbies of every kind and description—some good lobbies and some bad lobbies."

To digress for a moment, the situation with regard to lobbying reminds me of a story of a Yale Professor in English Literature who, having delivered himself of a very serious discussion on Shakespeare, and noticing a great lack of interest, suddenly said: "All those who now believe that Bacon wrote the Shakespearian plays, please stand up." No one stood up. After waiting a moment or two he said: "All those who believe that Shakespeare wrote his own plays, please stand up." Again there was no response. Irritated beyond endurance, he then said: "All those who don't give a damn, please stand up." At that the whole class arose and quietly left the room.

For the sake of argument, it may well be that lobbying — an effort of outsiders to influence legislation—is entirely wrong in principle. If it is wrong in principle, then *all* forms of lobbying are wrong. It is wrong for a newspaper to print an editorial commenting on some proposed law. It is wrong to write to a congressman or to a member of a State legislature, or even to speak to him on the street. To invite him to dinner should be made a felony, under that hypothesis. If lobbying is wrong in principle, then the only thing left to do is to elect our legislators, place them under lock and key, and let them legislate to their hearts' content; it should be made impossible for them to receive any information of any kind from any group that may be affected by their lawmaking propensities; newspapers and periodicals of all kinds should be withheld from them; and the only guides allowed them limited to an encyclopedia, a dictionary, a copy of the Bible, existing statutes, and a set of bound volumes of the *Congressional Record.*

Pacifist organizations condemn the "bigger and better" Army and Navy folks while insisting that they be allowed to continue their own efforts to guide legislation with regard to these matters. Protectionists condemn the Free Traders and the Free Traders condemn the Protectionists. Advocates of various new, strange and untried methods of production and distribution condemn great national industries for trying to protect their interests from legislation which may be inimical to them, while insisting on their own right to scatter as much of their own propaganda around our legislative halls as they please. Advocates of government ownership and operation of all sorts of business conduct their lobbying and broadcast their propaganda, while at the same time attacking lobbying and propaganda because the owners of various private enterprises do not agree with them and do not hesitate to say so to anyone who will listen to them. If lobbying is really bad—and in using the word I use it in its all inclusive sense—then let's wash out all effort to influence legislation in every direction and allow the elected representatives of the people to do exactly as they please in accordance with their lights and particular abilities. If we are going to create a chaotic condition, let's make it a real chaos and be done with it.

PERHAPS the most interesting people who deal with national institutions with a mental attitude which is iconoclastic are those who are very certain that the present system of operating the great public services—the light and power companies, the telephone, the radio, the street railway and the steam railroad—must be, for some reason or other, all wrong. They constantly hold them up as the outstanding "menaces" to "life, liberty and the pursuit of happiness." To them, every day presents a crisis in human affairs, largely because these public services are necessarily prosperous, which, to them, does not seem to be compatible with the public interest. The very simple fact that without prosperity they could not give the service which has become so commonplace as to attract little attention, seems to be beyond comprehension. They are very sure that if once the stimulus of private initiative is eliminated and government substituted for it, everything will be right with the world.

According to Sir Ernest Benn, the great English economist, Plato, the Greek philosopher and disciple of Socrates, was the first to advocate the public ownership of property and, as he says, "for twenty centuries people who were not so well off as they would like to be have argued that there was something wrong with private ownership."

THE argument still goes on today, yet for some curious reason or other the vast bulk of all the property in the world is still in private hands. "We are asked to believe that the whole would has been wrong through all the ages and that there is a better way," says Sir Ernest, "the way of public ownership. It wants some courage in the face of the accumulated experience of mankind to carry on this old argument, but Socialists and Revolutionaries make up in courage what they lack in brains." A little later in his discussion of this subject he says: "Public ownership (therefore) acts as a discouragement to those invaluable citizens who are by nature makers of wealth, and encourages the incompetents, the parasites, the passengers, the incapables and the pauper-minded."

Our iconoclasts, who would destroy our image of these public services as benefactors, and contributors to our rapidly increasing standard of living, tell us that the light and power companies, for example, are agencies of the State and that their employees are quasi-public officials. They forget that these employees are helping to *create,* whereas public officials only *absorb.* They say that they are agencies of the State because the State leaves to them the performances of its functions. This is putting the cart before the horse. The electrical industry functions, primarily, in the interests of the public, just as government functions, in the interests of the public, and, for this reason, becomes automatically a quasi-public institution. Without the support of the public it must fail, just as government of any kind, without the support of the public, must fail.

These "destroyers of images" who spend so much of their time worrying about the electrical industry, set up the claim that either the industry must be run for the consumers or for the capital invested in it; it cannot be run in the interest of both. There is something about this idea that suggests the word "bosh." The industry is being run today in the interest of both, as is every other successful, progressive, *productive* business. They overlook the fact that it is the investor and not the consumer who provides the funds for the improvement of service, for the building of plants and the extension of lines (although probably two million or more of the twenty-three million consumers are also investors while the funds of other millions of consumers are invested in the industry through banks, insurance companies and other fiduciary agencies). For this money the electric light and power industry is always in competition with the luxury trades and with ordinary business enterprises, where quicker returns are afforded.

Unless it can continue to hold the confidence of the investing public, capital, always timid, will flow into other and less disturbed channels and the progressive electrification of home, farm and shop will come to a standstill. Such a contingency would, indeed, give rise to a possible crisis in our social, industrial and economic life, which would be quite as serious as any alleged crisis which these iconoclasts might set up.

Another criticism which is "played" from the place of departed spirits to breakfast by our iconoclasts, who look upon the light and power industry as the source of all evil, is that the industry hasn't sense enough to see that a reduction of rates to domestic consumers will encourage consumption. Oh, if these folks would only keep up with the times! If any group in the United States is preaching the reduction of rates to the domestic consumer in order to encourage consumption with greater enthusiasm than the electric industry, I have never heard of it. Take the speech by Matthew S. Sloan, president of the National Electric Light Association, made at the 52nd convention. It is highly illuminating, and I insist that the industry itself knows more about this phase of its business than any single individual, or group of individuals, whose contact with the industry must be, to say the least, slight. Mr. Sloan, by the way, is something of an iconoclast himself, but he is, above everything else, constructive. He may be a "destroyer of images" to such an extent that he sees clearly and not with smoked glasses, but he builds more enduring images to take the place of those which are false gods and which he brushes aside as ruthlessly as the Soviet Government of Russia brushes aside the rights of the individual—and he builds the new images first before destroying the old. His is true constructive iconoclasm.

Most of the material issued by the iconoclastic critics of the electrical industry is, if read by the unwary, of a nature which causes them to be bogged down in the quicksands of glittering generalizations and a phraseology filled with implications stated almost as though they were facts. This is particularly true with regard to what they call the "failure of government regulation." In order to prove this failure they become exceedingly provincial, and no iconoclast should be provincial. In naïve fashion they call attention to the failure of some particular commission to act just as they think it should have acted in some particular case, and ignore other work and decisions of the same commission, or of other commissions, which have been in the interest of the consumer. Because of their lack of belief in private ownership and operation in any form, no matter how well it may be controlled under existing laws, they would destroy the whole image of control by properly drafted public utility laws, properly administered by honest, efficient and experienced public officials. As in the case of the dog in Aesop's fable, they would throw away the substance in their tireless search for a shadow which appears to them to be of greater value.

> **"There is no truer test of a man's qualities for permanent success than the way he takes criticism. The little-minded man can't stand it. It pricks his egotism. He "craw-fishes." He makes excuses. Then, when he finds that excuses won't take the place of results, he sulks and pouts. It never occurs to him that he might profit from the experience."**
>
> THOMAS A. EDISON

THESE iconoclasts have new and untried schemes to offer. They suggest that the public utilities be controlled through the medium of contracts between the State and operating companies. These contracts, they claim, would supplement the present regulatory system, which, they say, is almost wholly derived from the police power of the State. The only interpretation which can be placed upon this idea is that the State, having found it impossible to exert its police powers, should try, by cajolery or intimidation, to force the operating company into the making of a contract which will make it possible for the State to really exert its police power. This is like saying that if a jewel thief, well known to the police of New York City, is forbidden by the police to go below Fulton Street, and is found somewhere on Maiden Lane, the police department should take the position that it cannot enforce its dictum and therefore must persuade the thief to enter into a contract in which he agrees not to go below Fulton Street. They also forget that much forgotten document, the Constitution of the United States, which provides that no one can enter into any contract which will deprive him of his constitutional rights.

There are so many other ideas which these iconoclasts put forward in their effort to establish an alleged fact that the system of production and distribution which has made the United States the most prosperous nation in the world is all wrong, that it is impossible to even list them. They are dissatisfied, of course, just as all iconoclasts are dissatisfied, but there are two kinds of dissatisfaction, just as there are two kinds of iconoclasts. The real menace which we are facing is that these people might possibly be able to sell to the public the idea that public authority can, and should, confiscate; with utter disregard of the basic principle that while public authority can "confiscate and own," it cannot "make." To replace with public ownership those valuable citizens who are, by nature, makers of wealth, is to destroy the results of all of our work during the past fifty years. We use dynamite to blast the way for the erection of a great structure. Iconoclasm, the destruction of images, is all very well if it is used intelligently and to prepare the way for structures greater than those which have gone before.

James H. McGraw Prize Paper

The Electric Water Heater

By H. GEO. D. NUTTING

TO those who are giving the subject much thought, the electric water heater is steadily forcing its way to the front as a revenue builder.

Its appeal for serious consideration lies principally in the following points.

1. It has a load factor higher than any other residence load now existent.
2. It has practically unity power factor.
3. It furnishes a class of service that is a necessity in the home—hot water.
4. It has a favorable diversity factor.
5. It is safer, cleaner and more convenient than any other method of heating water.
6. It is as economical to install as any other convenient method of heating water.
7. It is reasonably economical to operate and compares favorably with other methods giving the same service.
8. It lends itself favorably to off peak operation, if desirable.

In view of these advantages no utility manager can afford to ignore the importance of organizing his forces to market electric water heaters in his territory, at the present time.

It is difficult to obtain reliable statistics, but indications are that there are at least 20,000 electric water heaters in use in the United States today.

We have every reason to believe that the next few years will see more than this number installed each year.

But a short time ago the slogan was "An increase of a Kilowatt Hour a day in residences."

Here is a device that will average from five to twenty kilowatt hours a day.

Certainly such a device demands our earnest and serious attention.

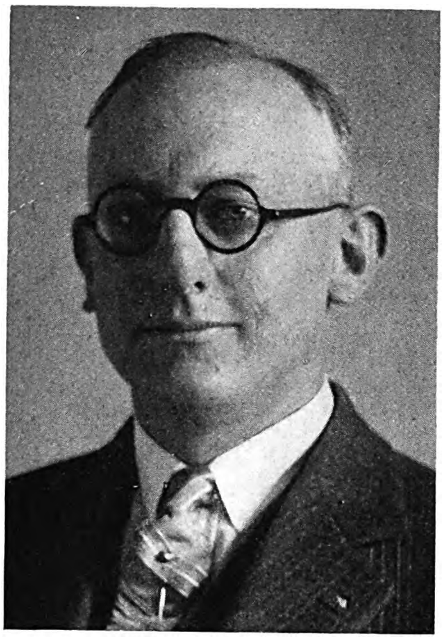
It is natural to inquire why the electric water heater is possible now whereas it was almost out of the question some years ago.

The answer lies principally in four reasons:

1. We have better heating elements now.
2. We have better thermostats.
3. We can make lower rates, due to operating economies and better average load factors.
4. The public standards of living are higher.

These reasons and some others have given us new views of this interesting load builder.

In this paper the writer will attempt to study the electric heater from all angles and offer an analysis which it is hoped will help central station managers to make decisions as to how to take advantage of the revenue producing possibilities of this appliance.



Mr. Nutting's paper won the 1928-29 James H. McGraw Second Prize Award He has been associated with the Detroit Edison Company as Power Sales Engineer for four years. A graduate of the University of Illinois in 1906, he has had wide experience since, as an engineer in both administrative and specialized work. He has also served in private practice as consulting engineer in rate cases and appraisals of public utilities and industrial plants.

The subject will be analyzed under the following heads:

1. What are the Customer's requirements?
2. What competitive methods are encountered?
3. What rates can the Utility make?
   (a) On Peak
   (b) Off Peak
4. What methods should be used in merchandising?
5. Descriptions of Heaters.

1—The Customer's Requirements.

Hot water is needed in almost every kind of a building—residences, apartment buildings, stores, golf clubs, garages, barber shops, factories, restaurants, doctors and dentists, office buildings, and so on ad infinitum.

The most inviting application, however, is the home. Any solution of the problem which satisfies the home requirements will automatically take care of nearly all other classes of customers.

In the home the amount of hot water needed usually depends upon:

(a) The number of persons in the family—particularly women and young babies.
(b) The number of bath rooms.
(c) The frequency of clothes washing.
(d) The frequency of bathing.
(e) Habits of waste and use.
(f) Standards of living.
(g) Differences in customs and temperatures in various localities.
(h) Miscellaneous uses.

Women use more hot water than men because they are usually more "finnicky" about cleanliness.

Young babies in the home are a source of large hot water requirements for both bathing and clothes washing.

A great difference exists between the standards of living of various families. Some folks are satisfied to turn on the hot water heater and wait an hour or two for hot water. Others want it "on tap" instantaneously. Some families take all their baths on Saturday nights, while others take them mornings or evenings throughout the week. Some folks want hot water under pressure only for bathing, and clothes-washing. Others want all their hot water "out of a faucet."

In some localities wash water is heated by servants over wood fires, while in others they use oil or gas exclusively. In many localities natural gas is available at low rates.

It is therefore evident that no general solution can be offered which will specifically apply to every locality and condition.

However, a large number of localities served by electric central stations will come within the points mentioned in this paper.

Experience with hot water heaters shows that the greatest requirements in the home come on wash day. On this day there is required the greatest quantity of hot water in the shortest space of time, i.e., the highest rate of flow or demand; also the highest temperature and the highest total quantity.

Any water heater that satisfies the requirements of wash day will usually easily satisfy the requirements of any other day.

In the ordinary family 30 to 50 gal. of water at 160 deg. Fahr., or higher, is needed to do the washing, and immediately after the washing is done there is likely to be at least one bath taken and sometimes two or three are taken.

These are the conditions that make it difficult to use low wattage heaters, in as much as their recuperation is comparatively slow.

Large storage tanks can be used but their heat losses, even when well insulated, are likely to be comparatively large. This condition is partially modified by the fact that a large tank can have a low wattage element and therefore operates at a good load factor. Such a heater will automatically earn a low rate, so that, in the last analysis, while the wattage losses may be high, the money losses may not be excessive. Actual examples of this will be given later.

From the customer's standpoint the ideal electric heater would probably be a high wattage instantaneous heater. To satisfy the demand for the speed of this day and age, a heater would have to be able to deliver about 3 gal. a minute, of 160 deg. water. Such a heater would be powered with 45 kw. A 15 kw. heater would give quite satisfactory service, but even this would introduce necessities for heavy entrance switches, wires, meters, etc., which make its use appear undesirable at the present time.

It is therefore necessary to compromise and use either large storage tanks with small electrical elements or small storage tanks with large electrical elements.

As between the two the writer believes that the comparatively small tank with the large element will furnish the most satisfactory service to the customer, but at a higher monthly bill than the small wattage heater, depending on the rate.

For example a 5 kw. element in an 18 gal. tank will give better service than a 1 kw. element in a 50 gal. tank. Also, at the same rate per kilowatt-hour, the 5 kw. heater will operate more economically, principally due to the lower heat losses through the insulation. The 5 kw. heater lends itself to manual or clock control and quick recuperation, thus making it unnecessary in many installations to maintain any high temperature water in storage. This affords an additional saving over the large storage type.

The larger element has the apparent disadvantage that it is usually necessary to increase the size of the entrance switch, when installing the heater, from a 30 ampere to a 60 ampere switch, and sometimes to even a 100 ampere switch. The change to a 60 ampere switch (from a 30 ampere) usually costs about $50, so that the overall cost of the heater installation is somewhat increased over the cost of the 1 kw. installation which will usually not exceed $10.

Some heater manufacturers sell the high wattage heaters at a higher price than the lower wattage heaters, and some sell the higher wattage at the lower price.

It is difficult, therefore, to make comparisons of first cost without knowing the make of heaters involved.

A discussion of the comparison of the demand and diversity factor of the two types of heaters will appear later.

Space saving, quick recuperation, lower cost of tank replacements, savings by virtue of manual or clock control, also are in favor of the high wattage, small tank heater. Costs of replacing burned out elements are against it.

The low wattage large storage tank heater lends itself better to off-peak operation, which, of course, does not apply to the high wattage small storage tank type. Off-peak operation and rates will be discussed more fully later.

An important consideration from the customer's standpoint is the point of installation of the heater in respect to the various plumbing fixtures in the house. Large losses result from drawing hot water through long bare pipes and leaving the pipes full of hot water which eventually turns cold thus losing the heat left in the pipes.

Water is usually drawn from kitchen faucets more *number of times* per day than from other fixtures. It is good practice, therefore, to install the heater as near as possible to the kitchen hot water faucet.

Hot water pipes should be thoroughly insulated when installed, preferably with not less than 2 in. thickness of asbestos-magnesia or air cell pipe covering. A heat trap should always be installed at the tank hot water outlet to stop local circulation in pipes.

Another good way to save heat is to have the electric heater provided with a two temperature thermostat. Clothes washing is the only process which requires water above 115 deg.-120 deg. The tank can be kept normally at this temperature until say the day before wash day, and the thermostat can then be turned to the 160 deg. point. Of course the objection can be raised that it may be forgotten, thus causing some inconvenience.

A very effective method of operation is by clock control. Users soon learn how long they need to allow a heater to run to get all the hot water they want for various purposes. This is a form of manual control, but with the advantage that the clock shuts the current off after a predetermined time interval has elapsed.

Heaters under water pressure having only manual control without clocks or thermostats are to be discouraged. There are cases on record where serious damage has resulted from accidentally leaving such unprotected heaters turned on.

Leaky faucets and careless waste of hot water by servants are problems which are sometimes difficult to solve. Some heater manufacturers provide rather clever devices to minimize these wastes. Spring faucets have been suggested and effectively used in many places to cut down waste. Their use is highly desirable.

After all the cost of operation of electric water heaters depends largely upon how much care and effort the user is willing to exercise to save electricity. This rule applies to any other method of heating water, but particularly to electric heating. Electricity has the advantage, however, that it lends itself to more easy control of the factors which make for economy than other methods of heating. It is easily turned on and off by simple switches after once having been properly wired.

Users who insist upon carrying a large storage tank full of 160 deg. water and maintain this temperature continuously close to the hot water faucets by means of circulating pipes, can expect to pay well for these conveniences.

Users who are willing to think a little in advance of their requirements and operate their heaters accordingly, can expect much lower hot water costs than those mentioned in the previous paragraph.

A novel scheme for saving current lies in the use of a heater with element and tank large enough for ordinary daily use, say 5 kw.—10 gal., but connected in parallel with the range boiler usually found in homes, attached to the furnace or house heating boiler. Between the two tanks, in the hot water pipe, is a valve which can be kept closed except when the need of a large quantity of water is anticipated for "wash day." Opening this valve will permit the whole range boiler to heat. After the washing is done the valve can be again closed and only the smaller tank used.

The writer has effectively used such an arrangement in his own home for some time.

No general figures can be given which will show the cost of heating water electrically. Manifestly the habits of use of the users control this.

It may be said, however, that average homes use from 150 kw-hr. to 500 kw-hr. a month, with an average for

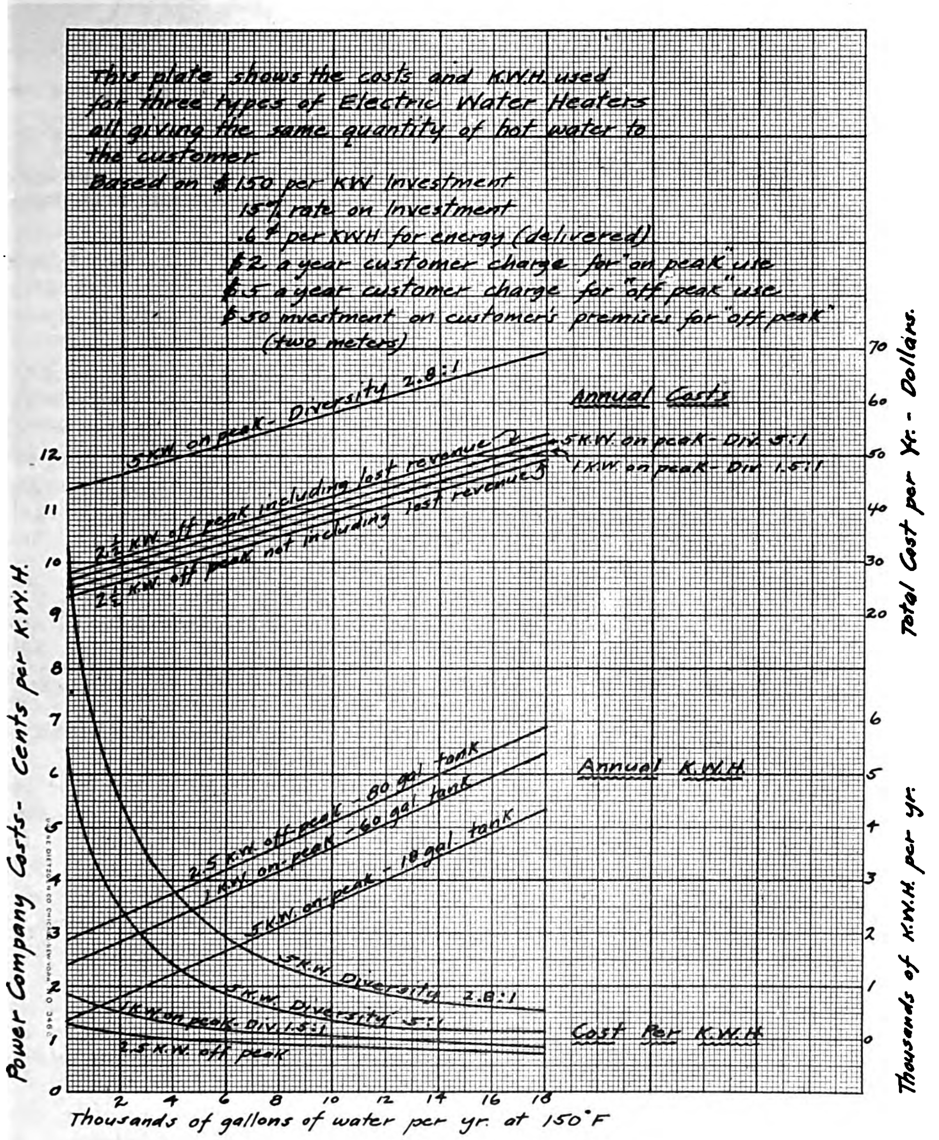


Chart 1

Costs and kw-hrs. used for three types of electric water heaters

summer use in the northern States around 200 to 400 kw-hr.

Some electric heaters are connected in series or in parallel with range boilers attached to house heating plants and continue to use a certain number of kilowatt hours all winter to supplement the heat furnished by the heating plant for hot water purposes. The range boiler also acts as a tempering tank in the summer-time.

For those who like statistics, the following figures are offered showing the use of hot water:

1. **Washing hands and face, shaving, etc., from a ½ gal. to 3 gal. at a time at a temperature of about 110 deg. Fahr.**
2. **Dishwashing, from 1½ to 5 gal. at 120 deg. to 130 deg.**
3. **Scrubbing, from 1 gal. to 5 gal. at 120 deg. to 130 deg.**
4. **Bathing, from 10 gal. to 30 gal. at 105 deg.**
5. **Clothes washing from 15 gal. to 50 gal. at 160 deg.**

These figures are very general, but will suffice to give some idea of the user's requirements.

The average family will use in the vicinity of 6000 to 10,000 gal. of hot water per year at 150 deg. Fahr.

Competitive Methods of Heating Water

It is hardly necessary to mention some of the old methods of heating water on cook stoves, or in range boilers attached to cook stoves by means of "water fronts" or "water backs." The cook stove "reservoir" was also quite popular 30 years ago.

The advent of the furnace or house heating boiler, usually installed in the basement, has also caused the unsightly range boiler to be moved to the basement.

Special coal fired or wood fired tank heaters have been installed for some years and more recently we have the gas fired heater, the fuel oil fired heater and the kerosene and gasoline heaters. Bottled gas and home gas plants, are now being offered.

In most cases the water is heated in winter by means of suitable coils and connections attached to the regular househeating boiler or furnace, leading to a 30 gal. range boiler, usually galvanized or of copper.

In some parts of the country it is necessary to use copper tanks and this also applies to tanks for electric heaters.

The greatest modern development has been in the use of city gas or natural gas for heating water. Gas heaters are now available, which are completely automatic, in both the instantaneous and storage types, and at prices within the reach of the average household. Well insulated tanks have contributed to economical operation. A comparatively recent design of heater is equipped with a low rate burner which uses only a small rate of flow of gas over long hours.

"Bottled gas" is now available for use in localities where more convenient forms of public service has not yet penetrated. This form of heat supply offers competition to electricity, the installation of which usually precedes that of city gas, in isolated communities.

The question is often asked—"How does the cost of heating water electrically compare with the various competitive methods?"

The answer is that none of these methods are really competitive. None can offer the three cardinal virtues of electricity, viz., safety, convenience and cleanliness.

The Electric Power Company's View Point. What Rates Can Be Charged. On Peak Or Off Peak

Most Power Company executives are much confused regarding electric water heaters. In the back of their heads they are not sure that electric heaters are sufficiently economical to recommend to their customers and they hesitate to make "promotional rates" for fear that they might promote too much business and turn present valleys into future peaks, with consequent increases in capital investment costs.

Further they can see no reason why they should make "class rates" to encourage this class of business. The writer is inclined to agree with this attitude. He believes that it is suicidal to pick out any particular appliance and make a special rate applying to it alone. A rate schedule should be so formed that appliances having high load factors, off peak maximum demands, and high power factors, will automatically earn a rate consistent with the cost of serving them.

In what follows the writer will attempt to make analyses intended to clear the atmosphere on the question of water heater rates.

It is now quite generally accepted that rates should adhere fairly closely to the cost of service of certain widely defined classes of service, namely:

Residence lighting and small appliances.
Small Power.
Large Power
Commercial Lighting.
Street Lighting.
And a few special classes like churches, water pumping, electric railway power, etc.

It is also generally agreed that the costs of service are made up of three main classifications of expense, namely:

1. Fixed (capital) costs.
2. Customer costs.
3. Kilowatt Hour costs.

Any attempt to go back over the theoretical calculations aiming at complete revisions of rate schedules, in this paper, would serve only to confuse the utility executive even more than he is already confused. It must be assumed that the present rates of most power companies are the results of developments based upon experience.

All we need to consider therefore is:

1. What rate will get the water heater business?
2. Will it be profitable to the utility?
3. In what form should it appear in the rate schedule?

1. *What rate will get the business?*

Of course no general answer can be given to this question for all parts of the country. In localities where 25c. natural gas is available the electric rate would need to be lower than in localities where only $2.00 city gas is available.

It is reasonable to expect, however, that the power company could in a measure take the same advantage of the low priced natural gas as the gas consumer could, although not to so great an advantage, due to the preponderance of fixed charges in the electric costs.

That low priced natural gas is not a controlling factor in selecting water heaters is proven by the fact that the American power company having the largest number of electric water heaters on their lines (over 6000 heaters), has put them on in the very face of natural gas competition (60c. gas). We understand the electric rate is 2c. a kilowatt hour, and that the average monthly bill for manually controlled heaters is $4.00.

The writer believes that a 2c. rate will get a very large volume of the available water heater business.

This of course means an "on-peak" rate, non-restricted as to connected load.

2. *Will water heater business at this rate be profitable to the Utility?*

This question invites an analysis of the basis structure of rates.

Let us assume that the total useful investment in a power utility is $350 per kw. of diversified demand. In other words, the useful investment divided by the peak demand is $350. It will be found to be somewhere near this figure in many well operated power companies.

Let us further assume that 15 per cent is a fair overhead charge for interest, depreciation, taxes, etc.

Then by simple arithmetic each kw. of demand on the system peak causes an annual fixed charge of 15 per cent of $350 equals $52.50. If a 1 kw. water heater is placed on the lines and its full demand comes on the system peak the company has to meet a fixed capital expense of $52.50 per year to serve it.

In addition to this fixed expense is the cost of energy, which of course varies in different places, but which we may assume for example to be 6/10c. per kw-hr. delivered at the customer's meter. Of course in some cases this will be 1c. or more.

Now let us assume that this customer will use 250 kw-hr. a month for six months out of the year and 100 kw-hr. a month for the other six months, all for water heating.

This amounts to 2100 kw-hr. a year, which at 6/10c. each will cost $12.60.

A further expense to the company will be the so-called "customer charge" which might add another $2 a year to the expense of service applicable to water heaters. (Note: Customer charges vary from $6 to $30. A good average would be about $15).

We then have a total of about $67 a year for 2100 kw-hr. or 3.2c. a kw-hr.

It should be noted that the above figures apply to only one 1 kw. heater placed on the lines. If a large number, say five hundred or more heaters, are put on, the diversity factor will be at least 1.5 to 1 and the demand charge per heater will be $35 instead of $52.50.

The over all yearly cost per heater will then be $49.60 or 2.36c. per kw-hr.

In order to definitely determine therefore what rate a given power company can profitably charge for water heating it is necessary to first determine:

1. What is the present and probable future investment cost per kw. of diversified demand?
2. What portion of this investment per kw. will be effected by increases in residence demand on system peak and on residence peak?
3. What is the diversity factor of electric water heating for both high wattage and low wattage installations?

In order to present to the reader a picture of the whole situation as to high or low wattage, and as to "on peak" or "off peak" rates an example will be given.

Let us assume we wish to install in an ordinary home with a family of four people an electric water heater to give automatic, continuous, reliable and satisfactory service.

For equivalent service to the family we have the option of installing, either—

1. A 1 kw. 60 gallon heater operating "on peak."
2. A 5 kw. 18 gallon heater operating "on peak."
3. A 2½ kw. 80 gallon heater operating "off peak" (assume the off peak period is 10 hours).

Which heater will give the lowest cost per month to the customer and what profitable rate must the power company charge in each case?

Assume the use of hot water is 2000 gal. a month at an average temperature of 150 deg., and that the electric heater furnishes all the hot water for six months and half of it for six months. First let us study the 1 kw., 60 gal. heater, which it is assumed will come on the system peak.

Experience and tests show that this heater will use 560 kw-hr. a month for the 2000 gal. a month period and 340 kw-hr. a month during the 1000 gal. a month period. (Note that the losses are figured at an average of 120 kw-hr. a month during both periods).

Information available at this time indicates that connected loads of 1 kw. will give a diversity of 1.5 to 1. In other words the summation of say 500 one kilowatt loads will give a peak demand of 500 divided by 1.5 equals 333 kw. and one kw. will contribute .67 kw. to the system peak demand. There is not sufficient data at hand to absolutely prove this figure, but for purposes of example the reader is asked to accept it for the time being.

The power company's cost of service will then be calculated as follows:

The increased investment in power house, and including some distribution capacity, will be about $150 per kw. of diversified peak demand. (See discussion of this figure later). The annual fixed charges will then be (for 1 kw. heater)—

$150 × 15% × .67 kw. = ...$15.05
The annual kw-hr. charge will be
6 Mo. @ 560 kw-hr. = 3360 kw-hr.
6 Mo. @ 340 kw-hr. = 2040 kw-hr.

Total for year = 5400 kw-hr.
@ 6/10c.. 32.40
Annual customer charge (assuming heater is connected on regular lighting meter), say............ 2.00

Total annual cost of service........$49.45
Average cost per month.......... 4.12
Average company cost per kw-hr.

$$\frac{\$49.45}{5400 \text{ kw-hr.}} = 915\text{c.}$$

Annual load factor based on connected load =

$$\frac{\text{kw-hr. used}}{\text{kw-hr. connected}} = \frac{5400}{1 \times 8760} = 61.7\%$$

Annual load factor based on maximum demand =

$$\frac{5400}{.67 \times 8760} = 92.2\%$$

Now let us calculate the cost of

serving a 5 kw.-18 gal. heater, giving the same service.

Preliminary tests made by the Detroit Edison Company indicate that the diversity of "high-wattage" heaters, based on the Monday peak, is 2.8 to 1.

The tests are not final but are based upon the measured observation of 4 heaters for 17 Mondays, and it is believed that further tests will show even better diversity than 2.8 to 1. For the purposes of our analysis we may assume that this diversity factor is reasonably correct.

The cost of service for this heater giving the same service as the aforementioned 1 kw. heater will be calculated as follows:

Fixed charges: (annual)

$$\$150 \times 15\% \times \frac{5\text{ kw.}}{2.8} = \$40.20$$

Energy charges:

Less kw-hr. will be used than for the 60 gal. tank because the tank losses of this 18 gal. tank will not exceed 35 kw-hr. a month compared to 120 kw-hr. a month for the 60 gal. unit. The total kw-hr. per year for this heater will be:

Useful heat in water
18,000 gal. × .22 kw-hr. = . . . 3960 kw-hr.
Losses 12 mo. × 35 kw-hr. = . . . 420 kw-hr.

Total kw-hr. per year = ... 4380 kw-hr.
@ 6/10c. = $26.28
Customer charge 2.00

Total annual cost of service $68.48
Average cost per month 5.71
Average cost per kw-hr. 1.56
Annual load factor based on connected load

$$\frac{4380}{5 \times 8760} = 10\%$$

Annual load factor based on individual heater's contribution to the system peak =

$$\frac{4380}{\frac{5 \times 8760}{2.8}} = 28.1\%$$

Now let us see what the cost of service of the 2 1/2 kw.-80 gal. heater is, when operated "off peak."

It is necessary to power this heater with a 2 1/2 kw. element to be sure that it will completely regenerate in the off peak time usually available (about 10 hr.). It takes 2 kd. per hour for 10 hr. to regenerate 80 gal.—100 deg. temperature rise, so this 2 1/2 kw. element leaves 1/2 kw. capacity to spare.

Investigation of the power house capacity released for 10 hr. (off peak) in one power company revealed the fact that about 30 per cent of the residence customers could be equipped with these 2 1/2 kw. heaters without making any investment whatever in increased facilities to serve them. The writer believes it is safe to assume that this type of heater need never be charged with fixed capital charges so far as plant equipment is concerned, except, possibly, for "class responsibility." This type does, however, introduce an element of fixed charges in control and metering equipment.

It requires a reliable control clock and an extra meter, and the installation, care and maintenance of this equipment. (Note: In certain types of rate schedules the special meter can be avoided).

The clock should be an electrical wound-spring operated clock so that it would not have to be wound by hand, and also so that power interruptions would not necessitate resetting. Clocks of this type are available for both A.C. and D.C. current.

Where a large number of heaters are installed it is now possible to use a form of "Resonant Control" which has been developed by the Westinghouse Company. This control scheme uses the regular power wires for conducting the control energy. It requires quite elaborate equipment at the sending end, but only a comparative simple relay (costing about $45), at the receiving end. No vacuum tubes are necessary, and it is claimed that the system is reliable. This system seems to offer possibilities for the future.

However, for the present, we shall confine ourselves to the clock control. To install a good clock and meter will cost in the vicinity of $50.

Our cost of service per year will then be as follows (for off peak service):

Fixed Charges:
15% of $50.00 . . . . $ 7.50
Kw-hr. Charges:

More kw-hr. will be used than by either of the previous methods. The losses of the 80 gal. tank will be about 160 kw-hr. a month. The annual kw-hr. will therefore be:

Useful heat in the water—
18,000 gal. × .22 . . . . . 3960 kw-hr.
Losses 160 × 12 . . . . 1920 "
"
Total Annual kw-hr. . . 5880 "
Annual kw-hr. cost is 5880 kw-hr.
@ 6/10c. = ... 35.28
Customer Charge:

This will be higher than for the other types because of the cost of maintenance of the clock and meter and because of the necessity for extra billing, etc. The writer believes this item should be about $5.00

Total Cost of Service 47.78
Average Cost per Month 3.98
Average Cost per Kw-hr. 812
Annual load factor based on connected load =

$$\frac{5880}{2.5 \times 8760} = 26.8\%$$

Annual load factor based on diversified maximum demand (assuming diversity factor 2 to 1)

$$\frac{5880}{\frac{2.5 \times 8760}{2}} = 53.6\%$$

A very important consideration in connection with this off peak installation is this:

A low rate cannot be advisedly made to apply to water heaters only, without permitting all other "connected" load to be thrown onto the "off peak" meter, during the off peak period.

This "other connected load" is, in most power companies, now paying rates, possibly in the vicinity of 4c. or higher. If it is permitted to be thrown over onto the off-peak meter, manifestly the power company will suffer some considerable loss in revenue due to this large cut in rate for a portion of its present load. This reduction in revenue would have to be charged against the off peak water heater rate, so that it would make it considerably higher than the on peak low-wattage heater rate.

The writer believes that there should be some general adjustment in rates giving the customer the benefit of the "off peak" cost reduction experienced by the power company, but it should come from an analysis of all the factors effecting off peak operation, not from water heaters alone.

Referring to the above calculations it will be noted that the fixed charges are an important element in the cost.

The gallonage figures used (18,000 gal. a year) are probably larger than would be required by the average residence. In places where the use is half this amount the annual kw-hr. used will be nearly proportionately low and the rate per kw.-hr. wlil be doublel.

For example suppose we study the 1 kw., 60 gal. heater from this standpoint, assuming a use of 9000 gal. of hot water per year, instead of 18,000 gal.:

Fixed Charges $15.05
Kw-hr. Charges:
9,000 gal × .22
kw-hr. = 1980 kw-hr. (useful)
12 mo. × 120
kw-hr. = 1440 kw-hr. (losses)

Total . . . . . . = 3420 kw-hr. @
6/10c. = 20.52
Customer Charges 2.00

Total Annual Service Cost $37.57
Average Monthly Cost 3.13

$$\text{Average Cost per kw-hr.} = \frac{37.57}{3420} = 1.1\text{c.}$$

Annual Load Factor based on maximum demand =

$$\frac{3420}{.67 \times 8760} = 58.2\%$$

In order to show the effect of water use load factor on the rate for the full range of load factor Chart I (page 643) has been calculated. It will be noted on the "Cost per Kw-hr. Curves" in Chart I that at low load factor, low wattage is desirable, but at higher load factors the annual cost is about equal for high and low wattage and off peak.

Also note that, if the "lost revenue increment" above referred to for "off peak" service is added to the "off peak" costs the 1 kw. "on peak" heater will show lower yearly bills than the "off peak" heater, as shown by the following calculation:

If it is assumed that one-third of the average customer's present normal annual kw-hr. use is reduced 2c. a kw-hr. by throwing it on the off peak meter this means an annual loss of, say, 240 kw-hr. times 2c. equals $4.80. Add this $4.80 to the "off peak" heater annual costs and it will be seen by reference to Chart I, that the customer's annual bills for the "off peak" heater, exceed those of the 1 kw. "on peak" heater. The rate per kw-hr. will then be about the same as for the 1 kw. "on peak" heater.

Attention is called to the fact that in the previous discussions we have referred to Power Company *Cost* figures and their effect on customers' bills, if they were also *rates*. The next question is:

What should the *rates* be and how should they be stated in the rate schedule?

On account of many contingencies and uncertainties it would not be wise to offer the exact costs developed in the foregoing discussion in the rate schedule. An addition of from 10 per cent to 20 per cent all along the line is advisable. For example, an addition of 20 per cent to the cost per kw-hr. shown on Chart I, for the 1 kw-hr. heater heating 10,000 gal. a year, would give a rate of 1.1c. times 1.2 equal 1.32c. per kw-hr.

For the same use the 5 kw. heater rate would be 2.1c. times 1.2 equal 2.52c. per kw-hr.

The customer's annual bill for the 1 kw. heater would be 1.32c. times 3650 kw-hr. equals $41.70 ($3.47 a mo.) and for the 5 kw. heater 2.52c. times 2600 kw-hr. equals $65.60 ($5.47 a mo.).

The rate schedule problem presented by an inspection of the cost curves shown in Chart I is no new problem. It simply again shows the load factor as the important element of the cost of service.

So far as the 1 kw. heater is concerned a flat 1 1/2c. rate could be added as a step in the residence rate schedule at a point beyond, say, 100 hr. use of the present demand. With some Power Companies this might be as low as 60 hr. use and with others it might run up to 150 hr. use, of the demand.

The principal difficulty is in finding a way to curtail the use of 5 kw. heaters at low load factor or charge them a proper rate if they are used. Inasmuch as the water heater alone is likely to be the appliance that both demands and affords the opportunity for the low step in the rate after about 100 hrs. use of the demand in residences, the following forms of rate schedule are suggested.

When the load factor type of rate is used a schedule might read:

10 c. per kw-hr. for the first step.
6 c. per kw-hr. for the second step.
3 c. per kw-hr. for use over the first and second steps where no heater or where a 4 kw. or 5 kw. water heater is installed or,
2¼c. per kw-hr. for all over the first and second steps where a 2 kw. or 3 kw. water heater is installed, or
1½c. per kw-hr. for all over the first and second steps where less than 2 kw. water heater is installed.

Manifestly this calls for service inspection; but it is believed that few water heaters will be installed without the Power Company's knowledge inasmuch as customers usually inquire of the Power Company before they install a water heater. Further, this rate is arranged so that the Power Company receives the highest third step until its attention is called to the fact that a customer has less than a 4 kw. or 5 kw. heater. The first or second monthly bill will usually suffice to direct attention to the element capacity of the water heater.

The "steps" above referred to may be based upon hours use of active load, number of rooms, area or any other basis already adopted by the Power Company. Where it is desired to put the water heater on a separate meter (on peak) and make a special rate, the above mentioned third step rates plus ¼ cent per kw-hr. for extra customer charges will cover.

Before leaving this phase of the subject the reader is reminded that the above rate figures are based on the following constants:

$150 investment per diversified kw. on the system peak.
15% of the above $150 for annual capital charge.
6/10c. per kw-hr. delivered at the customers' meter.
$2.00 per customer per year for operating overhead.

In those companies where these constants are different, the rates should be adjusted accordingly.

Discussion of Investment Per Diversified Kw. of Demand

$150 per kw. has been used for this constant. Can this be justified?

Early in this paper a figure of $350 per kw. was given for total investment per diversified kw. of system peak. This $350 is made up as follows:

Power Houses and equipment	$110 per kw.
Transmission lines and substations	$110 per kw.
Distribution system feeders and net work, including transformers and customers' services	$100 per kw.
Office Building utility equipment, warehouse and misc.	$ 30 per kw.
Total	$350 per kw.

So far as the Power Houses are concerned it is evident that any water heaters placed on the lines must stand their full share of system peak responsibility at the rate of $110 per diversified kw. of Demand. There is, however, some question as to how much responsibility they must stand in respect to transmission lines, substation, feeders, net work and distribution transformers.

Investigations and analyses made by the writer show that a great difference exists in the ratios of the capacities to present peak demands on the various substations of power companies. Some substations are very much underloaded and some are overloaded. Similarly with feeders and net work distribution systems, some are working below capacity and some over capacity.

Distribution transformers are generally loaded up to their working capacity. Without having any definite figures to support the statement, but basing it upon conferences with the Engineering Department of The Detroit Edison Company, it appears that on a whole this outside equipment is about two-thirds loaded.

This means that the average 10,000 kw. substation has about 3333 kw. still unloaded, and ready for future development. This same figure will generally apply to the feeders and net work emanating from the substation.

Assuming that such a substation and net work will have connected about 5000 residence customers who might put in electric water heaters of 1 kw. capacity each, the increased load on the substation and net work peak would be $0.67 \times 5000 = 3350$ kw. (0.67 being the diversity factor for 1 kw. heaters). In other words all of the residences on a given system could be supplied with 1 kw. electric water heaters without increasing the investment in substations or net work, except possibly in service transformers.

However, this does not say that the water heaters should have a "free ride" —but rather that, if we are to make sound rates, they must absorb their share of the total capital investment costs. These investment costs should be prorated on a basis of the on peak class responsibility (or equity factor) of each class of residence service, which on the average will be as follows:

(Note that these are diversified simultaneous demands)

Lighting	.20 kw.
Refrigeration and Misc.	.25 kw.
Range	.55 kw.
Water Heater (1 kw. element)	.67 kw.
Total	1.67 kw.

The water heaters' proportion will be

$$\frac{.67}{1.67} = 40.8\%$$

Therefore if the water heater takes its full responsibility for all the investment outside of the power house the annual capital charges per kw. against it will be 40.8 per cent of the investment in transmission lines, substations, feeders and net work per kw. of total diversified residence maximum demand. Note that the residence maximum demand probably does not come on the system maximum demand. For example, in the writer's company the system peak comes at 10 a.m. and the residence peak at 7 p.m.

As previously shown, for one company, the investment outside of the power-house in transmission lines, substations, distribution systems, and all other miscellaneous investment is $240 per kw. of system peak.

All of this investment is not, of course, used in serving residence customers.

So far as the writer knows there is no generally accepted method of determining what proportion of it is applicable to residence service.

This entire part of the investment is used for power and other classes of service besides residence service. The commercial power and residence service peaks do not superimpose.

It is permissible, therefore, to use an arbitrary figure on this, and the writer has assumed that, out of the $240 per kw. above referred to, $100 per kw. is the investment chargeable to residence service for the purposes of this analyses.

Taking the class responsibility or factor of equity as 40.8 per cent, the annual proportional investment cost per kw. of system peak chargeable to water heaters is $40.80.

Adding this to the power house investment cost ($110 a kw.) the total investment cost chargeable to water heaters will then be about $150 per kw. of system peak.

Importance of Diversity Factor

In all of the foregoing calculations it has been assumed that the system peak comes on wash day and that the diversity factor of the 1 kw. low wattage heaters is 1.5 to 1 and of the 5 kw. high wattage heaters 2.8 to 1. If the system peak comes some other day than wash day, and it usually does, the diversity factor of the 5 kw. heaters can be close to 5 to 1. The cost of service per kw-hr. annual kw-hr. and customer's annual bill are also shown on Chart I for this 5 to 1 diversity.

The basic calculations for one point on the curve are as follows:

Fixed Costs

$$\$150 \times 15\% \times \frac{5\text{ kw.}}{5} = \$22.50$$

Energy Costs for 18,000 gal. a year
4380 kw-hr. @ 6/10c. = ...$26.28
Customer Costs ....$ 2.00

Total Annual Costs $50.78

$$\text{Cost per kw-hr.} = \frac{50.78}{4380} = 1.16\text{c.}$$

Inspection of the curves (Chart I) shows this cost to still be higher than for the low wattage heater but only slightly so.

Merchandising Electric Water Heaters

The merchandising of water heaters is different than that of all other appliances, including the range. However, it is the same as the range in that with it must go a certain amount of education of the customer.

An automatic water heater does not demand the attention to economy that a range does. A range is continually subject to loss of economy through various acts of ignorance and carelessness of the operator, while the water heater economy can suffer only through unnecessary waste of hot water.

The most important element in the attempt to sell electric water heaters is a person at the head of the organization who uses an electric water heater in his own home and who has practical knowledge of how they are built and how they are piped and wired up. If the Power Company is a large one he should have trained assistants in all the branch offices so that confident, intelligent and reliable information can be given, to customers. Ordinarily until a company gets its heater sales well established, they should be placed in the hands of the Power Sales Division, rather than in the merchandising department.

When a customer is interested in a water heater, an inspection should be made of his premises and he should be advised as to the practicability of instaling the heater, how it will be piped and wired, how much the heater will cost him, how much it will probably cost him to operate it, how long it will last, what chance there is of the elements burning out and what it will cost to replace the elements. Any attempt to fool the customer on any of these points will act like a boomerang sooner or later.

If local plumbers and electrical contractors or other individuals, also sell heaters they should be instructed on the above points, and checked to see that they give the customer correct and honest information, for, eventually the come-back is on the power company.

In the writer's opinion water heaters should be sold to a Power Company's customers only by the Power Company and at a price high enough above cost to carry the water heater sales, and no higher. It is a Power Company's duty and obligation to place in the hands of it's customers all the electrical appliances available and wanted by it's customers at as low a price as can be reasonably made, and then to furnish service at the lowest price which yields a fair profit.

Sales promotion methods should be carried on with water heaters in the same manner as with all other appliances. These methods are too well known to need repeating in this paper. Every heater should be sold on a "money back guarantee" to furnish the service claimed for it.

Description of Commercial Water Heaters

There are at this time about twenty-five manufacturers of Electric Water Heaters in the United States. A number of variations in design and construction are offered, descriptions of which can be found in manufacturers' catalogs. Lists of these manufacturers can be obtained from the McGraw Publishing Company, publishers of the *Electrical World*.

An ideal electric water heater should have the following specifications:

1. It must be mechanically well built.
2. It must have an element that will not easily burn out or scale up.
3. The element must be easily removed for cleaning or replacement, preferably without turning off the water or disturbing the insulation.
4. It must be arranged so that scale and sludge can be conveniently removed from the tank and pipes.
5. It must have a reliable thermostat that will not get out of order for at least four or five years. The thermostat should be adjustable to operate at 120 deg. or 160 deg. but it should not be differentially adjustable.
6. It must be thoroughly insulated with a non-inflammable material at least as good an insulator as three inches thickness of hair felt, and of a nature to prevent condensation on the outside of the tank.
7. It must be well finished on the outside of the insulation covering with a material that looks well and prevents rusting and corrosion.
8. It must be arranged so that it can be conveniently installed with manual or clock control.

There are a number of heaters on the market that meet these specifications at least in part. A few manufacturers offer heaters with two or three elements differentially controlled. For example a heater may have 3-1500 watt elements only one of which is turned on a large proportion of the time. Claims are made that this is an advantage. In the writer's opinion it is a positive disadvantage.

It was pointed out in the foregoing discussion that the only time that the question of the electrical demand of the heater needs to be considered in the cost of service is on wash day, which usually is Monday morning. At that time all the capacity of a heater, and in fact of all the heaters where washing is being done, is needed at about the same time. Any curtailment of the use of the electrical capacity at that time is a loss to the customer. If this heater peak comes on the system peak this one day a week, plant capacity has to be provided for it

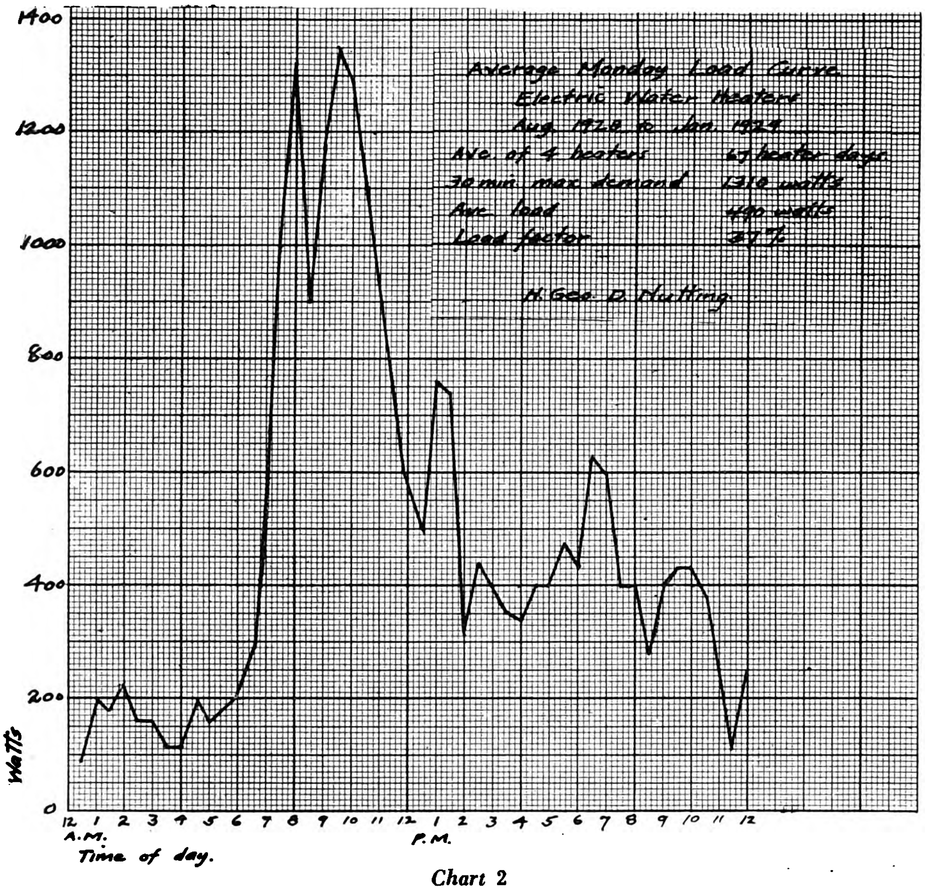

Chart 2

Average Monday Load Curve

regardless of the load on other days. The fact that only one third of the elements are on the rest of the week means nothing. It is like a man being dead—he can't be "any deader." This divided "on and off" feature is a benefit so far as flickering lights are concerned but its value does not justify any extra cost to make it available.

Similarly some manufacturers claim as an advantage a uniform temperature in the tank. In the writer's opinion arrangement of the element to give a high temperature quickly at the top of the tank is a distinct advantage over having a low uniform temperature. One gallon of hot water at 160 deg. is usually better than four gallons at 85 deg. although in both cases there are the same number of B.t.u. in the water. In other words what is wanted is not slow recuperation of a whole tank of water but fast recuperation of a comparatively small quantity, with eventual recuperation of the entire tank.

All sorts of methods for making and applying the heating elements are in use. One manufacturer places the elements in porcelain blocks around the outside of the tank and places the insulation over these blocks. He uses 4 in. thick of asbestos aircell insulation. In this design the heat gradient through the insulation is much larger than it is for heaters with the elements immersed in the water. On the other hand the distribution of the elements around the tank makes for a low heat dissipation per square inch into the water and holds down scale. This manufacturer claims they have never had to replace a burned out element. The elements are connected in series-multiple so that a burn out of one element would not be serious and probably would not even be discovered. This heater is controlled by means of a bimetal thermostat operating a magnetic relay which is claimed to be non-chattering. The writer has inspected a number of these heaters in service and has found them to be giving satisfaction.

A number of other heaters are made in the form of fire tube boilers, with the heating elements within the tubes. Several manufacturers claim to have patents on this arrangement. The elements are sometimes made by a chromium-nickel-steel alloy imbedded in a conductive electrical insulating cement, all encased in metal, and sometimes by winding an alloy element into spring like coil, placing it on a grooved lavite or porcelain tube and surrounding the whole thing by a copper or brass tube. Both of these types of elements are giving good service.

A common type of element is the so-called immersion element which is usually made of the alloy imbedded in the insulating cement under a heavy pressure, and the "blades" covered with copper sheaths. A common method of using the immersion element is in side-arm circulating heaters. This type of

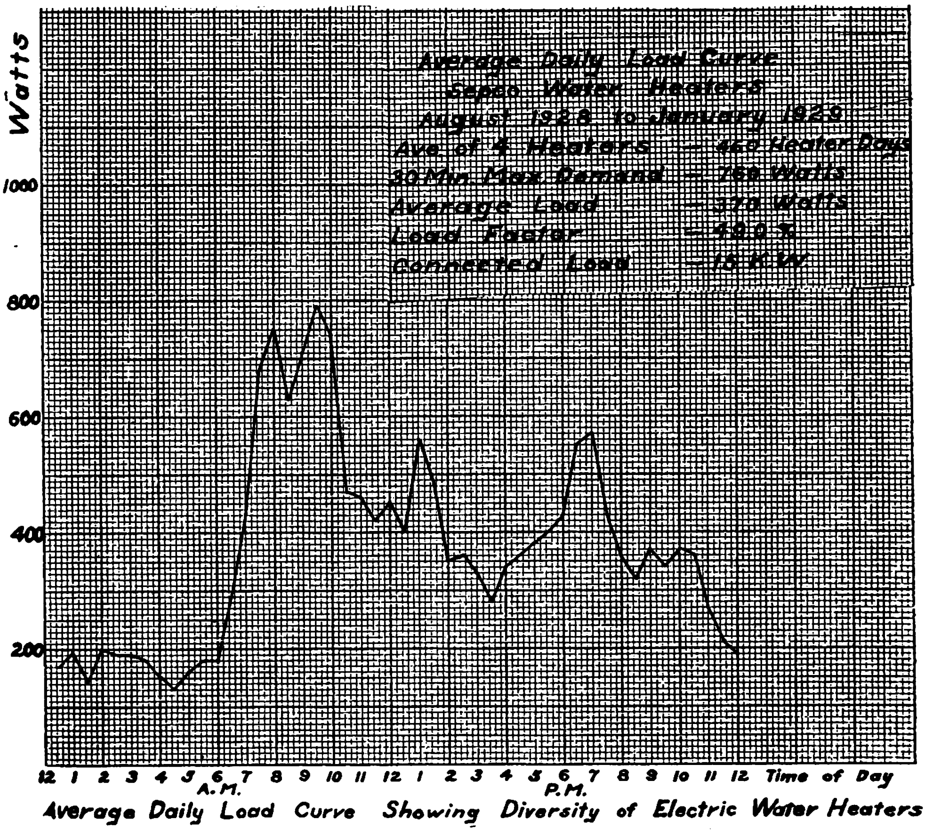

Chart 3

Average Daily Load Curve

heater has got into ill repute for reasons independent of the application of the sidearm. There is no reason why a side arm heater can not be as efficient as any other heater, and it has the advantage mentioned before that it delivers a small quantity of very hot water to the top of the tank quickly.

In installing heaters of this type care must be exercised to keep the element covered with water when the electricity is on, otherwise it might burn out. As a protection against this, the drain cock of the tank should be at a level above the top of the element and the balance of the connections so arranged that it is necessary to take the element out to completely drain the tank.

Some water heaters are made by immersing the uninsulated alloy wire heating element directly in the water. In some cases this has been successful, especially where a large surface of the element is used and the watts per square inch is low. The tendency usually is for the scale to collect on the element, thus raising the temperature gradient and eventually burning out the element.

One modification of this scheme is a heater immersed in water that has the scale forming matter "burned out" of it and arranged so that very little "raw water" gets into the element chamber. At first it was feared that these "direct contact" types of heaters were dangerous, but with modern methods of grounding this is not the case. At least information is that they have been approved by the National Board of Fire Underwriters.

Water rheostat types of heaters have been tried and found fairly successful. However, they have the disadvantage that the electrodes soon scale up and gradually reduce their capacity. The necessity for safe grounding is very urgent in this type of heater. Arc element heaters are offered and operate successfully.

A heater recently announced is operated by means of a low voltage-high amperage current from a transformer in the base of the heater. The secondary of the transformer is made of pipe and the water passes through this pipe thus becoming heated. The ends of the pipe secondary are short circuited through the bottom plate of the heater. This heater appears to be expensive to build but its design permits of low wattage per square inch heat dissipation, and therefore, should be good for hard waters.

Insulation

All kinds of insulations are used in electric water heaters. Those most commonly used are mineral or rock wool, cork, hair felt, balsam wool, asbestos air cell, asbestos magnesia and dead air space. Regardless of what is used, a thickness of at least 3 in. is required. Some heaters use 4 in. In all cases the insulation must be held firmly in place by an outside covering, which also must be attached firmly to the water tank itself.

All electric heaters should be equipped with manometer type heat traps with the hot leg preferably buried in the insulation. Every constructional advantage should be taken to save heat. Of the above insulation dead air space is the most to be desired if it really can be made dead. Mineral wool is cheap, and non-inflammable, and among the best from a standpoint of insulating value. Cork is very satisfactory, but not quite so inflammable as mineral wool. Hair felt has a very high insulating value but is inflammable. It is said that it also sometimes gets wormy after being in service for some time. The writer has never seen any cases of this worminess. There is still much to be desired in the way of insulations. Schemes along the line of the Thermos Bottle doubtless will be eventually developed.

Thermostats

Following are the types of Electric Water Heater Controls now available:

1. Bimetal strip (straight or coiled or helix) with relay contactor.
2. Bimetal coil or helix operating tipping mercury tube.
3. Bimetal coil or strip or helix displacing mercury with a piston.
4. Sylphon Bellows tipping mercury tube.
5. Sylphon Bellows making electrical contact, and operating relay contactor.
6. Sylphon Bellows operating mechanical quick break switch.
7. Spencer disc carrying quick break contacts.
8. Mercury thermometer with platinum contacting wire cemented into glass, operating relay contactor.
9. Mercury bulb making electrical contact which operates relay contactor. Electrical contact may be remote from bulb at end of flexible tube.
10. Mercury bulb operating mechanical quick break switch.
11. Expanding rod operating mechanical quick break switch.
12. Expanding rod operating relay contactor.
13. Expanding rod operating tipping mercury tube.
14. Vapor bulb and Bourdon tube—mechanical breaks.

Recent Prime Movers Committee Reports

Attention is called to recently published reports of the Prime Movers Committee which will be reviewed in the November issue of the BULLETIN.

These reports are:

Power Station Chemistry Part II—which is a report of the Chemists' subcommittee and includes a non-technical review of water treatment for steam generation; Condensing Equipment, being a study of performance records of single-pass and 2-pass condensers; and Turbines. This report presents a summary of the 1926 record of 153 turbines, 1927 record of 186 turbines and the detail 1928 record of 207 turbines. Tests on turbo-generator units ranging in capacity from 6000 to 60,000 kw. are included.

Of the above those principally used are the (a) Spencer Disc which is made and controlled (for water heating application) by the Westinghouse Company; (b) bimetal strips or coils operating relays or mercury tubes; (c) vapor bulb operating mercury tube or mechanical make and break contacts. (d) Sylphon bellows operating quick break contacts or tipping mercury tubes; (e) expanding rods or tubes operating mechanical quick break contacts or mercury tubes.

Practically all of the thermostats now in use are working quite satisfactorily. All have their benefits and their detriments and but few of the old troubles of dirty contacts, arcing and cementing, chattering of relays and total failure are now experienced. The improvement in thermostats has had a great influence in the development of the electric water heater.

The oil burner and the automatic gas heater have had much to do with forcing the development of thermostats. Without thermastatic control the electric water heater is impractical and dangerous. Some trouble is being experienced in getting suitable thermostats to operate on direct current, particularly in the higher wattages, but this can be effectively done at a little higher cost than with alternating current.

Conclusion

The writer has attempted to place before those interested a compilation of theoretical and practical experience with electric water heaters. Within the range of his own experience the data offered is accurate. No attempt has been made to cover all of the ground but rather to give the reader enough information to interest him in starting investigations of his own, to the end that the electric water heater may come into it's own as a central station revenue producer and as a service to the public.

The writer does not wish to convey the idea that this paper is the "last word" in water heating practice, but hopes that it will stimulate further thought, experimentation and discussion on this subject.

The author is indebted to Harry A. Snow, assistant controller of The Detroit Edison Company and Norman Wilcox, chairman of the N. E. L. A. Water Heater Committee for helpful suggestions. However, the writer's conclusions are not to be interpreted as their conclusions, or those of their companies.

Another Anniversary

The Opening of the Pearl Street Station in New York

By JOHN W. LIEB

Senior Vice-President, New York Edison Company

ON September 4, 1882—there occurred in New York City an event of epoch-making importance in the history of human progress.

On that day there was put into regular service a central electric power plant, at 257 Pearl Street, for the general house-to-house distribution of electricity through underground conductors for light and power purposes throughout a considerable section of the City, extending from Wall Street to Spruce and Ferry on the north and from Nassau Street on the west to the East River.

Electricity had previously, for a few years, been distributed in sections of some cities by means of overhead poles and wires to light, here and there, streets and large areas by electric arc lamps of considerable though uncertain intensity, spectacular in effect but far from satisfying the universal demand of a subdivided light of moderate intensity, without fluctuations and capable of universal application.

On October 21, 1879, Thomas Alva Edison had brought to a successful conclusion in his laboratory at Menlo Park, his exhaustive researches and experiments to produce a practical commercial incandescent electric lamp.

By the last day of December, 1879, sufficient progress had already been made in the commercial development of his lamps to undertake a public exhibition on a considerable scale at Menlo Park, in the presence of thousands of visitors.

With the facilities for the product of the lamps on a commercial scale, exploitation of the Edison System of Electric Lighting was energetically promoted.

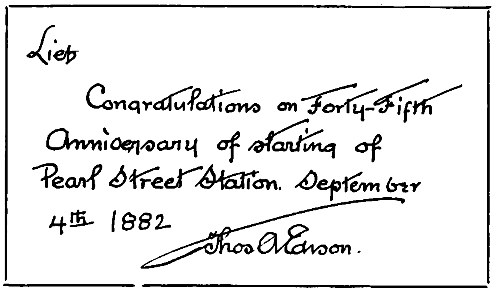
Private generating plants were installed in 1881, in a number of private houses in New York, among others in the residences of Messrs. Morgan, Vanderbilt and J. Hood Wright, and in a number of stores and factories—the very first being the printing establishment of Hinds Ketcham & Company, followed by E. S. Jaffray & Company, the New York Post Office and the New York *Herald*.

It remained, however, for the old Pearl Street Station to provide a complete demonstration of the commercial practicability and economic feasibility of the Edison System of Electric Lighting and convince the most skeptical that the problem of the generation and distribution of the electric current through a complete underground system to thousands of lamps located in many buildings throughout a considerable area had been completely solved.

WE have mentioned the development of the incandescent lamp—the keystone of this great enterprise—which, having been accomplished, Edison rounded out with one invention after another in rapid succession, all of the many elements necessary to the perfection of a complete commercial lighting system.

He developed a dynamo which marked a distinct advance upon anything previously known, characterized by an enormous improvement in efficiency; complete apparatus for regulating and controlling the current; the design of a complete multiple arc system of distribution, making each lamp independent of the other; a complete system of underground conductors, with tube feeders, mains, junction boxes and service boxes, with switches and fuses; a complete interior wiring system with switches, sockets, cutouts, safety plugs and other devices, and that most essential device for the successful business exploitation of the system, the electric meter for measuring the current delivered to the consumer.

Let us now consider in some detail this Pioneer of Central Stations. The building occupied by the station itself covered an area 25 x 100 feet and was an ordinary 4-story and basement brick structure, in which the first and second floors had been removed and stiff steel girders substituted, designed like an elevated railroad structure with foundations in the basement. Four Babcock & Wilcox boilers, with a rating of 240 horsepower each were installed in the basement, with coal and ash handling equipment. Six jumbo dynamos, each of a capacity of 1,200 lamps, directly connected to a Porter-Allen (later Armington & Sims) engine, each of 125 (rated) horsepower were installed in the steel structure, thus making the total capacity of the plant 7,200 lamps, or, roughly, 750 (rated) horse-power.



Lieb

Congratulations on Forty-Fifth Anniversary of starting of Pearl Street Station. September 4th 1882

Thos A Edison.

The station was provided with a traveling crane and exhaust feed-water heaters, exhausting into the atmosphere, as the plant was non-condensing. The dynamos were connected by huge knife switches to the bus-bars on the walls running along each side of the station and to which the 24 underground tube feeders entering the station from the street side were connected.

The upper floors were occupied by the feeder regulators and indicating apparatus and a test lamp bank of 1,000 lamps.

When this pioneer station was started, and in fact for some time afterward, there was not a single electrical station instrument in the whole station—not a single voltmeter or ammeter! The station was, however, in every respect a perfect prototype of the most modern type of central power plant, with provision for every emergency, coal bunkers, reserve water tanks, forced draught blowers, etc., etc.

As previously stated, the station was started September 4, 1882. On October 1, 1882, there were connected to the station 59 customers in whose premises were installed 1,284 lamps; on January 1, 1883, the connected load had been increased to 231 customers, with 3,477 lamps installed.

It is important to note that from the first inception of the system Mr. Edison had provided that motors should be capable of being supplied from the very same wires as the lamps and, in fact, the first motor was connected to the system in 1884 and the first multiple arc lamp in 1889.

Such was the pioneer electric light and power plant in New York City, out of which has grown one of the greatest of the world's great industries.

1879 and Now

Light's Golden Jubilee and Our Tribute to Thomas Alva Ec

By S. E. DOANE

MR. EDISON is accredited by many with the invention of the incandescent lamp. If I were speaking to my associates and among those exactly informed I might use the same expression for the sake of brevity because to Mr. Edison we assign the credit for having given to the world the first practical incandescent lamp as a crown and climax to a system for making available the subdivision of the electric light of which I shall have more to say later.

The facts are, however, that there were many so-called incandescent electric lamps before Mr. Edison made his. The earliest ones were made before he was born.

Very few of them would operate for more than a few minutes before burning out and their light-giving qualities were highly variable throughout their evanescent lives.

They were all of low voltage and could only have been used in series on distributing circuits for general illumination because of this low voltage. So serious was this voltage limitation that all proposals for such use was for series burning, although there was nothing novel in operating electrical apparatus in parallel.

Into this chaos came Mr. Edison's complete operating system crowned with a practical lamp.

Mr. Doane is Chief Engineer of the National Lamp Works of the General Electric Company, Nela Park, Cleveland. This paper was given before the joint convention of the Rocky Mountain Division, N. E. L. A., the Colorado Utilities Association and the Wyoming Utilities Association, held at Glenwood Springs, Colo., September 2-4

FIFTY years ago the wonderful, scientific age in which we are now living was just beginning to take form. For the purpose of this story which I am attempting to depict, let us divide into two periods this age of metals which began before our time and in which we are living. The first period will never end, but it began when metals were used for replacement of other materials where the metals performed a better or cheaper function than the materials they displaced but where their use did not bring to the world any thing with which it was not already somewhat experienced. In this class I would place the use of steel and iron, for railroads, for the framework of buildings, for the construction of ships, etc.

All of these uses were replacement uses and were of vast service to mankind. The use of iron and other metals for other purposes, such as their use in steam engines and boilers to furnish power, has not introduced to the world anything for which the world was not fully prepared. We properly hear much credit given to the wonderful steam engine and while its invention did permit power to be more generally used, power had been made by wooden water wheels for generations and was not a novelty in the academic sense.

The second period, to which I have referred, was that period which began when people began to understand that the scientific discoveries which had found their principal expression in giving to the world certain metals contained potentialities beyond replacement values, unknown and undreamed of by the older generations. In this second class will fall all electrical development. The inventors of the electric telegraph had already given people a hint of the wonders to come. Mr. Edison was one of several pioneers in this electrical field, though probably the greatest of them all.

When Mr. Edison the dynamo had been ir well known to the scie was used for electro-pl ing, etc. It was princi ever, for arc lighting. teries and storage bat known. It was clearly dynamos and storage b used for telegraphy, et use of scientific knowle field of the second peri mentioned was for th electric light by means bon arc.

It is important to note that from the first inception of the system Mr. Edison had provided that motors should be capable of being supplied from the very same wires as the lamps and, in fact, the first motor was connected to the system in 1884 and the first multiple arc lamp in 1889.

Such was the pioneer electric light and power plant in New York City, out of which has grown one of the greatest of the world's great industries.

1879 and Now

Light's Golden Jubilee and Our Tribute to Thomas Alva Edison

By S. E. DOANE

MR. EDISON is accredited by many with the invention of the incandescent lamp. If I were speaking to my associates and among those exactly informed I might use the same expression for the sake of brevity because to Mr. Edison we assign the credit for having given to the world the first practical incandescent lamp as a crown and climax to a system for making available the subdivision of the electric light of which I shall have more to say later.

The facts are, however, that there were many so-called incandescent electric lamps before Mr. Edison made his. The earliest ones were made before he was born.

Very few of them would operate for more than a few minutes before burning out and their light-giving qualities were highly variable throughout their evanescent lives.

They were all of low voltage and could only have been used in series on distributing circuits for general illumination because of this low voltage. So serious was this voltage limitation that all proposals for such use was for series burning, although there was nothing novel in operating electrical apparatus in parallel.

Into this chaos came Mr. Edison's complete operating system crowned with a practical lamp.

FIFTY years ago the wonderful, scientific age in which we are now living was just beginning to take form. For the purpose of this story which I am attempting to depict, let us divide into two periods this age of metals which began before our time and in which we are living. The first period will never end, but it began when metals were used for replacement of other materials where the metals performed a better or cheaper function than the materials they displaced but where their use did not bring to the world any thing with which it was not already somewhat experienced. In this class I would place the use of steel and iron, for railroads, for the framework of buildings, for the construction of ships, etc.

All of these uses were replacement uses and were of vast service to mankind. The use of iron and other metals for other purposes, such as their use in steam engines and boilers to furnish power, has not introduced to the world anything for which the world was not fully prepared. We properly hear much credit given to the wonderful steam engine and while its invention did permit power to be more generally used, power had been made by wooden water wheels for generations and was not a novelty in the academic sense.

Mr. Doane is Chief Engineer of the National Lamp Works of the General Electric Company, Nela Park, Cleveland. This paper was given before the joint convention of the Rocky Mountain Division, N. E. L. A., the Colorado Utilities Association and the Wyoming Utilities Association, held at Glenwood Springs, Colo., September 2-4

The second period, to which I have referred, was that period which began when people began to understand that the scientific discoveries which had found their principal expression in giving to the world certain metals contained potentialities beyond replacement values, unknown and undreamed of by the older generations. In this second class will fall all electrical development. The inventors of the electric telegraph had already given people a hint of the wonders to come. Mr. Edison was one of several pioneers in this electrical field, though probably the greatest of them all.

When Mr. Edison began his work the dynamo had been invented and was well known to the scientific world. It was used for electro-plating, electrolizing, etc. It was principally used, however, for arc lighting. Primary batteries and storage batteries were also known. It was clearly understood that dynamos and storage batteries might be used for telegraphy, etc., but the chief use of scientific knowledge in this new field of the second period which I have mentioned was for the production of electric light by means of the open carbon arc.

PEOPLE had welcomed this wonderful, new illuminant for street lighting. The news was flashed around the world that here was something which had tremendous possibilities but which also had one great deterrent for domestic use, which was that this wonderful new light was much too big and too brilliant for use in interiors. It was true that many stores, big buildings, auditoriums, etc., had adopted it, but everywhere people appreciated a need for which there had been coined a phrase. People soon came to know very well what was meant when it was said that we needed to find a way "to subdivide the electric light."

In every age there are certain well defined problems. Mr. Edison tackled one of the outstanding ones. He had already done notable things in telegraphy, etc., and because of his remarkable work had won money and backing with which to go ahead. It was this with which he embarked on a great big glorious adventure, as truly a pioneer in a real new world as if he had blazed a trail into an uncharted wilderness in a geographical sense.

For the sake of the younger men I will attempt to further clarify the picture by drawing an illustration from modern conditions.

We all know that there are fascinating possibilities in air travel, but that there are two tremendous liabilities which are still associated with it.

One is, that because our present planes must maintain a high speed, they cannot settle down on a small lot, as does a bird. When the power fails, they must maintain a considerable speed to the point of landing, or crash.

We also know that there are times in fog or storm that they cannot land as up to the moment no one has known how to give them the necessary information as to the landing field which is necessary for their sucessfully so doing. These two needs are so well known that they are common property.

In a parallel sense it was just as well known and understood that the "subdivision of the electric light" was an outstanding need for the successful development of electric lighting in Edison's time. Men comprehended that distributing systems would probably be developed to fit around the proper solution which might or might not require new knowledge but no one knew whether or not we would require new knowledge until they knew the requirements for this sought "subdivision of electric light."

IF I have succeeded in giving you a picture of the conditions preceding Mr. Edison's great contribution, you will understand how the older men all appreciated that it is no deterrent to Edison's fame that he was able to use a dynamo not much different from a common type, that he used insulated wires which were known or that when he made his underground system, he used existing knowledge. It is rather to his credit that his solution permitted him to use many things which did not require much modification to make them fit into the new system. The small modifications which were required, however, were often essential to make some of the older development meet the new needs.

I hope that I have made it clear that when we say that Edison invented the incandescent lamp that what we really mean is that Mr. Edison saw with crystal clearness that it would be posssible "to subdivide the electric light," if he could make a very thin filament which would therefore have small area, if he could make it sufficiently long so that it should have high resistance, and if he could guard it so that it would not change for many hours. He knew that he would be able to feed this thin conductor thus produced with electricity through wires which would not be prohibitively large and expensive. He saw that it would be desirable to run these lamps in multiple to facilitate turning them on and off.

While this conception gave us an incandescent lamp, I trust that I have made it clear that Mr. Edison was not primarily inventing an incandescent lamp. It is true that his type of incandescent lamp was the key-stone to his arch, and that it was the definitely novel and different thing which permitted him to put before the world an invention and achievement which formed the foundation for the tremendous development of the second epoch of scientific fulfillment then just beginning to take form.

Incandescent lamps were known before Mr. Edison was born, just as oil lamps were known before kerosene was discovered; just as savages used torches of resinous wood, long before we have any record that they knew how to surround something which answered as a wick with resin or grease to make a candle. The whole story of human development has been one of gradual evolution and so it was that there were many early forms of incandescent lamps made by people whose names it is not necessary to list here.

Mr. Edison was able to make a mental picture of a system from fuel to lamps, all of which depended upon his being able to make a certain kind and type of lamp. So true was his vision, and so thoroughly did he comb the field of existing knowledge that the lamp of October 21, 1879, proved to be a true prototype.

I have read over many hundreds of patents referring to incandescent lamps and lighting systems. Mr. Edison's contributions were enormous but by no means were they the only contributions. The indefatigable workers of those days, just as now, produced invention after invention until the number aggregated hundreds. No search for gold, nor any stampede for land allotments in our West was more strenuous than the efforts of these pioneers.

HOOVER EXPECTED AT DEARBORN, OCT. 21

TENTATIVE travel plans made by President Hoover will, press dispatches say, bring him to Detroit on October 21 in time to address the culminating celebration of "Lights Golden Jubilee" to be held at Dearborn under the auspices of Henry Ford and at which Mr. Edison, reported to be rapidly recovering from his recent serious illness, is expected to be present.

Announcement comes from 27 states, so far, that an official character will be given to the celebration by Governor's proclamation or message. These states are Arizona, Arkansas, California, Florida, Idaho, Illinois, Indiana, Kentucky, Maine, Maryland, Massachusetts, Michigan, Nevada, New Hampshire, New Jersey, New Mexico, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, Tennessee, Texas, Utah, Wisconsin and Wyoming. Ohio, where Edison was born; Michigan, where his youth was passed, and New Jersey, where his chief inventions were made, are naturally especially eager to participate in the jubilee, and their respective governors—Myers Y. Cooper, Fred W. Green and Morgan F. Larson—in their official utterances are emphasizing the connection of Edison with their commonwealth.

When I speak tersely and say that the solution was reached in a filament of high resistance surrounded by a high vacuum, it gives but a faint picture of the many, many experiments by which these two things were obtained. Mr. Edison found, for illustration, on many occasions that although he had obtained a vacuum which was sufficient by any of the laboratory standards of the day, that the filaments he had made and which he believed to be alike performed differently, one from another, when made into lamps in the days following the famous day of October 21, 1879, when he first saw success in sight. This was regardless of the fact that the vacuum surrounding these filaments was quite acceptable according to the standards of the day. His patents show that he searched indefatigably for the causes of the slow deterioration of his filaments. In this process he discovered the electonic discharge which was then called the "Edison effect" and which since has been utilized to give us the radiotron.

IF anyone thinks that we are overemphasizing the credit due the master mind which gave us our solution, let him invent a heliocopter or some other solution to give us our airship with the negligible landing velocity, or better yet, let him devise a scheme by which even the modern plane can safely land though the aviator be blinded by storm or fog.

These solutions all are easy after they are made. You gentlemen, who have pioneered here in the Rockies, with the pioneer transmission problems in this territory know that it is simpler now to carry a hundred thousand volts across the Divide than it was to similarly provide for ten thousand volts in the old days.

I have welcomed this opportunity to say to you what I have said. My disposition is to say much more but I have lively recollections of the reminiscences of the older men when I was a youth, and how difficult it was for me to understand and share the enthusiasms of my elders.

Light's Golden Jubilee has been universally accepted as an opportunity to give credit to one of the great victories of Peace.

There are many monuments to the achievements of passion—to war madness and the like—there are voluminous records and artistic delineations of deathless jealousies, intrigues and double dealings. We celebrate in Light's Golden Jubilee the achievement of reason and hard work and the name of a popular hero of both. Quite the opposite to passion and intrigue.

Depreciation Accounting Methods for Public Utilities

By L. R. Nash

THIS paper deals with only that part of the broad subject of depreciation which relates to the method of accumulating adequate reserves through which to retire property that ceases to be useful. Only incidental reference will be made to the valuation phases of the subject. The discussion is further restricted to the field of public utilities as they exist in the United States because of the special conditions under which their operations are conducted.

Nearly all public utilities are subject to regulation by governmental bodies, usually state commissions. Theoretically, their operations are monopolistic, and one of the primary functions of regulation is to fix rates which will yield a return to investors consistent with that which they could obtain from investments in other industries with similar risks. Such regulation implies that the cost of service, including operating expenses and taxes, depreciation requirements, and a fair return upon the value of the property, shall be readily determinable. Obviously, this requires a system of accounts which consistently reflects the financial showing and operations of the properties.

Refinement in such accounting is in many respects more important than in other industries operating on a competitive basis with prices determined by the law of supply and demand. Even in these industries more careful attention is now given to depreciation accounting because of its bearing on federal income taxes. The word "depreciation" has acquired so many meanings that, to avoid confusion, the more definite term "retirements" will be used herein for some of the matters under discussion.

Depreciation Accounting History

Although the major developments in the public utility field have occurred within the past forty years, the investment in electric power, gas, local transportation, water, and communication utilities in the United States is already approximately equal to the total investment in steam railroads, and the combination of utility and railroad investments is, in turn, approximately equal to the total investment in all manufacturing enterprises.

The early years of public utility history were devoted to pioneering and development work, with comparatively little attention to accounting. Depreciation was given scant, if any attention. In fact, prior to the Knoxville decision of the Supreme Court in 1909, there were several court decisions denying the right to allowances in excess of current repairs. Other than for isolated instances, no attempt at broad standardization of utility accounting was undertaken until about twenty years ago. In 1909 the Interstate Commerce Commission made effective a system of expense accounts for interstate electric carriers. In 1914 the Commission revised and enlarged this system to cover all classes of accounts, including definite provisions for depreciation charges and reserves. These provisions applied to all classes of railway property, but were made compulsory only for rolling stock. The State regulatory commissions have found this system generally suitable for the intrastate electric railways under their jurisdiction, and no other system of railway accounting has been extensively used.

Mr. Nash is very widely known as a public utility economist. He is Public Utility Engineer for Stone and Webster, Inc., and Chairman of the Rate Research Committee of the National Electric Light Association. This paper was presented before the International Congress of Accounting, held in New York, Sept. 9-14.

In the meantime various State commissions had developed their own systems of accounting for other classes of utilities under their jurisdiction, there being no corresponding federal agencies. While these systems were basically similar, they differed in many details and occasioned much confusion and annoyance to utilities operating in more than one State or to groups of widely distributed affiliated utilities. This difficulty was duly recognized by the various regulatory bodies, and in 1919 the National Association of Railroad and Utilities Commissioners appointed a special committee to draft a uniform system of accounts in collaboration with accounting representatives of the national utility associations. Such a uniform system, with appropriate subsidiary details for electric, gas, and water utilities, was completed and formally approved by the Association in 1922. This approval was not binding upon the members of this Association in their official capacity as commissioners of the several States, but the uniform system has gradually been prescribed by the State regulatory bodies until at present three-fourths of the States authorized to prescribe accounting methods have adopted this system. Since the development of this standardization, only one State for special reasons have adopted any other system. Other States are contemplating the adoption of this system, and still others would have done so but for the fact that their own previously prescribed systems agreed so closely therewith as to make a prompt change unnecessary.

In 1927 the Interstate Commerce Commission, after further consideration of the subject of depreciation, proposed a more complete and detailed system of depreciation accounting for interstate electric carriers, corresponding to a similar system proposed in the preceding year for railroads. This procedure was in conformity with the provsions of Section 20 of the Transportation Act of 1920, requiring the Commission to determine the classes of property for which depreciation charges may properly be included in operating expenses, together with the extent of such charges. It is to be noted that the Act in question contains no direct mandate that any such property shall be so classified. The order of the Commission making the new system effective in 1928 was first suspended and then withdrawn for further consideration because of widespread criticism.

Two Present Standard Systems

The utilities in the United States, therefore, have two major systems of accounting: (1) the system developed by the Interstate Commerce Commission for interstate carriers and a similar system for communication companies under its jurisdiction; and (2) the uniform system developed by the State commissions for local utilities under their jurisdiction. These are herein referred to as Interstate and State systems respectively. In general, there are few fundamental differences between the two systems, both embodying recognized and established accounting principles. There is, however, a striking difference between the Interstate and the State systems with respect to depreciation accounting.

The Interstate System used by carriers and communication companies, and similar systems adopted by the Federal Power Commission and to some extent by federal income tax authorities, are based on the general theory that utility property is gradually consumed in service, that the useful life and salvage value of the various property elements are known with reasonable accuracy, and that uniform charges should be made in operating expenses for currently accruing depreciation. This is not done for the property as a whole, but major units or groups of similar units must under existing practice have separate subsidiary reserve accounts provided for their retirement, and deficiencies in one of these accounts may not be made up from excess in another. In other words, the charge against any subsidary reserve in connection with a particular retirement is limited to the amount previously accrued therein with respect to the units of property involved. This so-called straight-line system of depreciation charges is intended to create and maintain a reserve consistently equal to the accrued depreciation of the property, and under Interstate regulatory practice it is considered appropriate to deduct such reserves in determining the fair value of the property. However, this latter practice is not approved by the Federal courts.

Pending the contemplated revision of Interstate depreciation accounting methods, the following quotation from the 1914 classification for electric carriers, relating to depreciation charges on equipment, will indicate the character of methods now in effect:

> This account shall include uniform monthly charges representing the depreciation of equipment. These charges shall be based upon the percentage of the original cost (estimated if not known), record value, or purchase price of such equipment determined to be equitable from the carrier's experience and best sources of information as to the average current loss from depreciation.
>
> A statement of the basis used by the accounting carrier for computing the charges hereto shall be included in its annual report to the Interstate Commerce Commission.
>
> Depreciation charges with respect to any unit of equipment shall cease when the difference between the ledger value and the estimated scrap value shall have been credited to the accrued depreciation account.
>
> Note A. All charges to this account shall be concurrently credited to balance-sheet account No. 443, "Accrued depreciation—Road and equipment."
>
> Note B. When any unit of equipment is retired the difference between its ledger value (less salvage) and the amount previously taken up in the accrued depreciation account for such unit shall be adjusted in the month in which the retirement occurs as follows: The proportion of the actual loss from depreciation assignable to the period prior to July 1, 1914, shall be charged to Profit and Loss and the remainder shall be charged to Account No. 41, "Equipment retired."

The State system of accounting involves a quite different theory and provides a reserve for retirements rather than depreciation. In fact, the word "depreciation" does not anywhere appear in the State system of accounting. This system proceeds upon the assumption that it is not practicable, or at least not necessary, to determine the useful life of property elements. It provides for a reserve, not to offset loss in usefulness or value but, rather, for the purpose of equalizing retirement costs. Even if equality existed in the amount of the reserves created under the two systems, a fundamental difference still exists, in that it is not required that the reserve be accumulated uniformly or through charges included wholly in operating expenses. The method of accumulation of the retirement reserve may best be described in the language of the uniform system with reference to the single retirement reserve account from which the following is quoted:

> To this account shall be credited such amounts as are charged to Operating Expense Account "Retirement Expense," appropriated from surplus, or both, to cover the retirement loss represented by the excess of the original cost, plus cost of dismantling, over the salvage value of fixed capital retired from service. When any fixed capital is retired from service, the original cost thereof (estimated if not known, and where estimated, the facts on which the estimate is based should be stated in the entry) should be credited to the proper fixed capital account and charged, plus the cost of retirement, less salvage, to this account. If the credit balance in this account is insufficient to cover the retirement loss, the excess over the balance contained in the reserve should be charged to account No. 132, "Property Abandoned," which see, or other appropriate account.
>
> The losses which this account is intended to cover are those incident to important retirements of buildings, of large sections of continuous structures, like electric line, or of definitely indentifiable units of plant or equipment, and the purpose of the account is that the burden of such losses may be as nearly as is practicable equalized from year to year, *but with due regard for amount of earnings available for this purpose in each year.*
>
> (Italics supplied.)

It will be seen that the basic difference between Interstate and State systems relates to useful life, the first assuming that this can be determined with reasonable accuracy and that appropriations should be uniform, the second assuming that useful life is uncertain and that flexibility in appropriations is not only reasonable and proper for that reason, but also for stability of income and maintenance of credit. In the light of this difference it is pertinent to inquire into the facts as to the certainties or uncertainties of useful life of utility property.

Facts Regarding Useful Life

The author has made careful studies of this subject based on a practical experience and contact with local public utilities for a period of more than thirty years. This experience does not include communication companies, which have materially different characteristics from other utilities and may justify different treatment. Based upon this experience, the author cannot subscribe to any theory implying a definite or even approximate knowledge of future usefulness of existing utility property. Changes and developments so far in the major groups of utilities have been both rapid and radical. Many substantial units thoroughly modern when installed have ceased to be useful when not more than one-third or even one-fourth of their expected useful life had expired. Other such units have survived far beyond the expected period of life although their actual usefulness has usually been curtailed. Many conscientious efforts have been made by groups of utility accountants or engineers representing national organizations to standardize useful life data. These efforts have uniformly failed because experienced participants have insisted that such efforts would be not only futile but misleading.

The Wisconsin Railroad Commission is among the oldest of our regulatory bodies having jurisdiction over all classes of utilities. Its decisions and practices have commanded wide attention and high regard. A few years ago it caused its staff to make an exhaustive study of useful life data, including all available published information. Tentative life tables applicable to Wisconsin conditions and covering all classes of property were compiled. They showed maximum and minimum normal expectations and, in general, the former were at least 50 per cent, and more commonly nearer 100 per cent, larger than the latter. Furthermore, accompanying explanatory notes stated that many units would fall far outside these limits, indicating extreme difficulty in determining any definite useful life data. The Commission has, accordingly, refrained from any such procedure, as have other similar regulatory bodies. In the light of such action with respect to localized property, subject to known routine climatic and other conditions, the greater difficulty in forecasting useful life of property not so localized, subject to widely varying conditions and influences, is obvious.

It is sometimes contended that the utility industry has emerged from its period of rapid evolution and may expect greater stability in its future technical development. Such contention cannot be logically accepted in the light of the present transition in methods of local transportation, long-distance transmission and interconnections in the electric power industry, superpressure steam generation, mercury boilers and turbines, high-pressure transmission of natural and manufactured gas, and the possibilities of a non-toxic complete gas—all suggesting further significant and perhaps radical changes in facilities.

Causes of Retirements

The problem of useful life may be clarified by an analysis of the causes of retirements. These causes may be broadly divided into two groups, physical and functional. The former includes wear, decay, corrosion, and other similar causes related to actual service or exposure to the elements. The effect of the factors in this group may in a given locality be predetermined with reasonable accuracy, but in different localities and under different service conditions there may be wide variations.

Functional causes may, in turn, be divided into groups which have sometimes been designated as obsolescence, inadequacy, and supersession. The first named factor in this group, obsolescence, involves the results of scientific research, engineering developments, changes in the art, and economic progress, all of which, as already indicated, have a very important influence on utility property. The term "inadequacy" includes those causes of retirement due to growth and physical development of the business. In the electric power industry this has been particularly effective, and many important units of equipment, especially in power stations, have ceased to be useful after only a few years of service because they were no longer large enough to play an important part in dependable service. These influences are and will continue to be effective without substantial abatement, at least for a considerable period of years.

The third group of functional causes, supersession, includes those originating in governmental requirements or public demands covering changes in character of service or facilities incident to community growth, civic pride, or other factors not properly included in the two previous groups. Specifically, this group includes street paving and re-paving, changes in type of rolling stock, substitution of underground distribution systems for previously existing pole lines, or metal or other ornamental poles in place of ordinary ones, changes in character of lighting equipment, and other similar factors.

It has been the writer's uniform experience and observation that comparatively few important elements in public utility property are retired because they are worn out or have decayed, or for other physical reasons. The preponderance of retirements is due to the functional or non-physical causes just described. While specific data substantiating these statements are not commonly available, one particular study, believed to be typical and covering a long period of years, will serve as an illustration.

A railway property in a western city analyzed retirements during a period of approximately twenty years, involving about $1,000,000 of investment. It was found that only 14 per cent of this total amount covered retirements because of wear and tear, corrosion, and other physical causes, including accidents. The remaining 86 per cent was due to obsolescence, inadequacy, and municipal or other public requirements in which, of course, paving played a substantial part. Nearly one-half of the trackage of this property is located on private interurban right of way, but, in spite of this, it may be that railway property located in other cities of slower growth and less prosperity would show a lower percentage than that stated.

It is of interest to note that if this property throughout the period studied had made straight-line appropriations for depreciation for all its property, based on conventional estimates of useful life, it would have accumulated a net reserve amounting to one-third the total investment in the property, which reserve would be three times the reserve actually created under the more flexible system of appropriations in effect.

Corresponding figures are not available for other classes of local utilities, but it is to be expected that they would show a somewhat smaller proportion of retirements for non-physical causes. Changes corresponding to those in railway track and paving requirements are not involved, but the more rapid growth of other utilities, particularly electric power, makes the obsolescence and inadequacy factors of great importance. It is estimated that not far from 75 per cent of the normal retirements of important units of these other classes of utilities are due to non-physical causes, and only 25 per cent to physical causes. Passage of time is a direct factor in the latter group, but has little if any direct influence upon the former. It may be that more definite, specific data, when obtainable, will show that the non-physical percentage here estimated is high, but it must be noted that replacement of small units through maintence charges is not under consideration.

The conclusion to be drawn from the foregoing analysis of useful life data is that time is only a minor factor among the causes of retirements, and that it should not be the sole or even a major basis of retirement appropriations. This being true, the straight-line depreciation accounting system lacks a logical basis for its support unless by some means the necessary errors in estimating the lives of various property elements may be used to counteract each other. It is generally true that the sum of a group of estimates is more accurate than the various components, and this is undoubtedly the case with utility useful lives. Such averaging is, however, permitted to only a limited extent in the Interstate system. Major items or groups of similar items have restricted reserves which may not borrow from or lend to each other, thereby nullifying a possible gain in accuracy.

This disadvantage would be partially reduced by suggested revisions in the proposed Interstate system, which provides separate reserves only for each main group of fixed capital accounts, but the obstacle to real accuracy would still remain. It would still exist if a single composite reserve were permitted so long as it was based on a fixed percentage derived from weighted average life. The State system, as already mentioned, has one expense account or the alternative surplus as the source of the single reserve which makes for maximum accuracy regardless of the basis of charges.

Other Interstate Accounting Characteristics

Turning now from useful life uncertainties, it is in order to consider other phases of the Interstate system. It is, of course, true that errors in estimates, when detected with the passage of time, can be corrected, but such corrections may seriously distort operating expenses, in which depreciation charges are included, and require explanations and analyses for the satisfaction of executives and investors. The accounting work required by such changes and by the system as a whole is voluminous and expensive, and not warranted by the results secured. The Commission proposes to increase still further these accounting complications by including within the scope of the reserve accounting many small items heretofore handled through maintenance accounts. These include such items as ties and poles, which are replaced with approximate uniformity on all large properties, with a minimum of accounting cost.

The extent to which maintenance accounts are now used to record replacements varies through wide limits. Large properties, to a greater extent than small ones, can replace important units in this way without disturbance of income statements. The large railroad systems have often stated that they need no reserve for equalization purposes, except possibly for large terminal developments. Some of the largest electric power and gas systems are similarly situated, and it is common practice to restrict the use of their reserves to retirements of costly units of property. The State system of accounts does not clearly define the size or cost of units which may be replaced through maintenance accounts. Further definition is under consideration, but, for consistency with existing provisions for flexibility, it may well be avoided unless expressed in relation to total investment in all classes of property. Many utilities have found that a combination of maintenance and retirement charges affords a better guide to full property upkeep than separate consideration of retirements.

Incidentally, it may be noted that the estimating of salvage value, to be recovered many years hence when units of property are retired—this being a necessary step in the determination of "wearing value" which must be accounted for—involves many uncertainties, the controlling factor usually being the ratio of demand to supply of certain basic raw materials at the particular time of retirement.

As will be shown more fully in subsequent discussion, straight-line depreciation charges are larger than corresponding retirement charges, and, in the absence of offsetting factors, require more revenue and higher rates for service. Customers are, therefore, directly interested in the matter and may protest against a system which causes them to contribute toward utility financing and further protection to invested capital, without adding to the safety or reliability of the service they receive. Such protests have been made in numerous rate cases.

It may also happen that large, uniform charges for depreciation in years of underdevelopment or business depression may so disturb utility credit as to make financing of extensions and improvements impossible, to the detriment of both customers and community. There have been cases in the traction field where a strict application of Interstate accounting methods to all classes of property has resulted in a failure to show gross income sufficient to meet interest obligations. Receivership has not necessarily resulted because a large part of the cash involved in unnecessary depreciation charges, included in operating expenses, is commonly available for other immediate necessities.

Further references to weaknesses in the straight-line system are here unnecessary and would unduly extend the discussion. In justice it should be stated that it has real advantages where business stability permits, where revenues are derived from rates which are well within the value of service, and where adequate and conscientious executive supervision is not assured.

Sinking-Fund Method

Before passing to consideration of details of the retirement system, a word may be in order regarding the sinking-fund method of accruals. It is the only other method than those herein discussed which has been given noticeable attention in this country, and its actual use in utility accounting has been very limited. It is clearly the proper method to use in many economic studies, but its complications for routine accounting are objectionable. It is particularly difficult to apply it equitably to a mature property which has previously used some other system and presumably has an accumulated reserve quite different for that which a sinking fund would have developed in a similar period.

The sinking-fund method is a modification of the straight-line method under which interest accumulations are added to a reduced annuity to yield the same total at the end of the estimated useful life. It is a dangerous modification, particularly for property of long life expectancy, because the annuities are then radically reduced and depend largely on interest accumulations in the later years for creating the required reserve. If, under the uncertainties of useful life, an important property element ceases to be useful long before its estimated life has elapsed, the sinking-fund reserve for its retirement will be wholly inadequate. Statistical demonstration of this fact can readily be drawn from standard tables of sinking fund accumulations.

It may, however, be pointed out that the sinking-fund method has one advantage in rate cases. It avoids an estimate of accrued depreciation as a factor in fair value based on actual or theoretical accumulated reserves, because such reserves, invested in the property, as they usually are, must earn a return for their own accretion and cannot be excluded from the rate base. An interesting and simple modification of this method has had regulatory approval. Under it accumulated reserves, by whatever method created, are allowed to earn a fair return which is deducted from the annual appropriations otherwise suitable to determine the current depreciation factor in the cost of service.

This method, in effect, has been widely used. Under flexible systems of retirement accounting the earnings of all property, including that in which the reserve is invested, automatically go into profit and loss account. The annual appropriation from this account to the retirement reserve is made up of two factors: (1) contributions of customers toward retirement needs; and (2) earnings of the invested reserve. The former item only need be included in statements of the current cost of service to be collected through rates, provided that an undepreciated rate base is used. The propriety of using an undepreciated value is one of the distinct advantages of this method which is not widely followed in rate cases but is, nevertheless, consistent with common, although perhaps not standardized, procedure. This plan, in fact, is equally appropriate whether reserves are created under the straight-line, sinking fund, or flexible methods. It requires that the depreciation reserves shall be definitely and equitably separated from surplus, a matter which should have careful attention under any procedure.

State System Characteristics

Turning now to the State system of retirement accounting, the central feature calling for attention is its flexibility. This may be permissible to a greater extent for public utility property than for other classes because of the unlimited life of the public utility business. It is not conceivable that public utility service as now existing can be abandoned. On the contrary, most branches will continue to expand and become more and more necessary to community life and prosperity. Industrial units of other kinds may come and go, their existence depending in part upon life of patents, competition, fashions, individual prosperity, and many other factors. It is reasonable that such an industry should include in the cost of its product the amortization of a substantial part, if not all, of its investment within a reasonable period of years. If, on the other hand, public utilities are to go on without limit, similar amortization is less necessary.

Public utility industries have in recent years shown a notable stability in their revenues and income. The successive phases of the conventional business cycle have less effect on public utilities than on other industries. Fluctuations in income of substantial proportions, nevertheless, occur, particularly in those units of the industry which operate in industrial districts. It is this relative stability of public utility income which has made investments in public utility securities increasingly attractive in recent years. Coincidentally, there has been a decrease in yield from public utility securities, to which this increase in stability has contributed. Stable employment or compensation permits lower unit wages for capital as well as labor.

Lower cost of money means correspondingly lower cost of service. If stability of income and a corresponding improvement in credit are significant factors in the cost of service and in the corresponding rate structures, it is logical that credit should be protected and stimulated in all reasonable ways. The exceptionally high investment in public utility facilities in relation to annual revenues is a well-recognized characteristic. With an investment of about five dollars per dollar of revenue, the capital "turnover" period is about five years as compared with less than nine months in the average industrial establishment. This high utility investment is largely due to the greater proportion of the value of product or service created within the industry itself, averaging about 80 per cent as compared with half that amount in other typical productive enterprises. From 30 to 40 per cent of the revenues from public utility service is normally required for interest, dividends, and surplus. Even a small saving in these requirements is a much larger proportion of the total revenues than is found in any other industries, and such saving is correspondingly more important.

The State system of retirement accounting under which reserves are created through charges to operating expense or appropriations from surplus, or a combination of the two, does not undertake to define the relative proportions of the two contributing factors to the reserves, nor the extent to which flexibility in charges is permissible. It is sometimes urged that this is a serious and perhaps vital weakness in this system in that necessary provision for impending retirements may be omitted or unduly postponed, or, under other conditions, excessive appropriations made leading to the accumulation of excessive reserves and treated as a part of the current cost of service.

There is undoubtedly merit in this criticism, and in the absence of close regulatory supervision, a distorted showing of prosperity, or lack of it, may result either intentionally or through negligence. Such possibilities, however, should not lead to condemnation of a system otherwise meritorious but should indicate the need of a systematic as well as flexible system of charges. In the opinion of the author, constructive steps in this direction are needed to remove from this system of retirement provisions any just charge that it may be erratic and misleading.

Methods of Securing Flexibility

There are various ways in which this result can be measurably accomplished. If an estimate of useful life, even if adjustable from time to time, and percentages derived therefrom, do not recognize controlling factors in the determination of retirements, there may be other bases of retirement appropriations which tend automatically to adjust themselves to changing requirements.

Among other methods which have been widely used as the normal basis of retirement appropriations are gross earnings and units of output or service. Such methods have repeatedly been criticized as illogical if not misleading. Careful consideration will show that such criticism lacks sound foundation. Assuming that retirements are largely occasioned by the non-physical causes already enumerated, let us analyze these causes to see what, if any, relation they have to utility revenues.

Taking them in their order, obsolescence leads to the abandonment of facilities which are relatively inefficient and not in keeping with modern scientific standards of service. The extent to which property will be retired for such causes depends in a substantial part upon the prosperity of the business measured roughly by its revenues.

Inadequacy, which is probably the most important cause of retirements, arises directly from growth in business. The more rapid the growth the sooner generators, gas holders, services, transformers, rolling stock, and other facilities become inadequate and are replaced by larger units. Revenues are a direct and automatic measure of inadequacy and, therefore, of necessary provisions for retirements due to these causes. A uniform percentage of revenues or a corresponding charge per kilowatt-hour, per thousand feet of gas, or per car mile will tend to maintain retirement reserves proportional to needs.

Supersession is of a similar character. As cities grow underground systems are required or extended, new street lighting installations are demanded, new types of transportation become better adapted to community needs, and paving requirements increase. As the community grows more or less rapidly, so do utility revenues, and again a percentage based on revenues or service units tends automatically to maintain adequate reserves.

It is not contended that such a system of charges will be wholly successful in continuously maintaining an adequate reserve, but it is the author's opinion, based upon personal experience with retirement provisions made or checked by such methods, applied to many widely distributed properties and covering a period within which more than 90 per cent of public utility development has occurred, that this system yields more satisfactory results as to adequacy and timeliness of appropriation, together with stability of credit, than any other known system.

If one seeks for greater refinement and wishes to include a stable portion of retirement provisions in operating expense, the total appropriations might be divided into two parts: (1) a charge, to be included monthly in operating expenses, covering physical deterioration, depending on lapse of time and involving substantial uniformity; and (2) an allowance based on non-physical causes in which flexibility may be permitted, and for this reason best provided for by annual appropriations from surplus.

If fluctuations in volume of business give the necessary flexibility, the total retirement provisions might be expressed in the form of the following formula:

$$A = \frac{V}{n} + Rp$$

In this formula A represents the required total annual provisions for retirements; V is the investment in useful property or, if preferred, those portions of it subject to retirement for physical causes; n is the number of years of weighted average useful life; R represents annual revenues; and p is a suitable percentage applied thereto to provide for the non-physical factor in the appropriations. The first factor may readily be converted into uniform monthly charges.

If, as will probably be the case, such a formula does not give sufficient flexibility, it may be modified into the following form:

$$A = \frac{V}{n} + R(p \pm t)$$

The new factor t in this formula is a so-called tolerance factor by which the normal percentage may be increased or decreased as occasion requires. The first factor remains unchanged because deterioration is assumed to be constant. Such a formula furnishes a rule which may be applied by accounting staffs under executive supervision.

It is interesting to note that various efforts have been made by the federal income tax authorities to standardize useful life of property to facilitate their checking of income tax returns. Some time ago they requested contractors engaged in construction operations to make estimates of this character based on their experience. After careful consideration the contractors reached the conclusion, and so reported, that no fixed estimates can be made of useful life of construction equipment because of varying conditions of operation and extent of use, but that with a suitably broad tolerance factor, a general formula for exhaustion, wear, and tear might be adopted as a basis of depreciation claims in income tax returns. After due consideration the income tax authorities recently decided to abandon, for the present at least, any such program.

Executive Responsibility

It is not wholly clear that even the final formula stated above, embodying double possibilities of flexibility, is wholly satisfactory for practical use in that it puts into the hands of accountants with only intermittent executive supervision the problem of fixing retirement provisions. The necessary supervision is not consistently available in many cases. It is believed that this matter is one for real executive responsibility rather than merely supervision. Accountants cannot know in detail the physical condition of existing property, the need of impending or remote retirements, prospective technical developments, political influences, and adequacy of existing reserves, for which matters executives should be responsible. It is quite as logical that boards of directors, assisted and advised by operating executives, should pass upon retirement appropriations as that they should be responsible for declaring dividends and making other appropriations from surplus. Accountants should not question this procedure as it relieves them of the necessity of including in the operating expenses figures that they know cannot have the accuracy embodied in all the remaining compilations and that cannot be cleared or reconciled at annual intervals as are certain other necessary suspense accounts.

Such executive action may have a formula as its basis or as a check, although it is the author's view that an informed judgment exercised at least annually and expressed in a round sum of money, in the light of the various significant factors just mentioned, may be more in the interests of the utilities and their customers than a more automatic and less flexible procedure. It is obvious that such action, or even the fixing of tolerance percentages in such a formula as is suggested herein, requires not only judgment and experience but, perhaps more important, a consciousness of a definite purpose and a recognition of a public trust.

To this end every utility should have a definitely determined goal which it should consistently aim to approach. This goal may be a reserve of a certain magnitude determined by the character of the property. In years of depression the approach toward this goal may be insignificant, but in years of prosperity prior shortages should be overcome. In other words, during a suitable period of years the average movement toward the goal should be reasonably uniform. Our past experience with business cycles indicates a duration of from three and one-half to ten years. The former period is clearly too short in which to establish a suitable average, and the latter period may not be too long.

It is possible—and perhaps desirable—to recognize flexibility also in the goal in question; in other words, the size of the reserve. During a period of continued prosperity liberal appropriations might build up a reserve of substantial size (15 per cent or more of the investment in the property). On the other hand, a series of unfavorable years or large withdrawals might permit the reduction of the reserve to possibly half its intended maximum amount without endangering the safety of the property or its service. Such a program embodies the possibility of a stable return to investors and the use of the retirement reserve as an indicator of the adequacy of rates similar to the barometer fund found in service-at-cost railway franchises. If the reserve fell below a reasonable minimum, the need of additional revenue and higher rates would be obvious. If, on the other hand, with adequate return to investors, the reserve passed a reasonable maximum point, the utility should voluntarily undertake to reduce rates.

Size of Retirement Reserve

The size of a suitable retirement reserve cannot be arbitrarily fixed within any such limits as above suggested. Under a depreciation reserve policy, with accumulations on a straight-line basis, the accrued depreciation is theoretically equal to the reserve, but this theory has not always been accepted in valuation cases. Our federal courts have repeatedly held that such a reserve, although supported by refined computations made at large expense, was merely an accounting record and not controlling in determining present fair value. Our regulatory commissions, which are concerned with the equities of property rights rather than their confiscation, have given less attention to accrued depreciation in fixing the rate base than have the courts, but for the time being there is always the possibility in rate cases that in final adjudication substantial deductions may be made for accrued depreciation, even when investment is the starting point. Where, in the light of local regulatory history, such possibility exists, the utilities are justified in protecting themselves against it by creating reserves from their revenues sufficient for both retirements and designated accrued depreciation. It is not necessary that the two should be combined in accounting records. In fact, there is much logic in keeping separate retirement records for statistical purposes and analyses of adequacy, leaving the supplementary provision for accrued depreciation in the corporate surplus, which is the customary source of unusual and contingent withdrawals.

Up to the present time it has not been common practice among the regulatory commissions definitely to limit retirement reserve accumulations. There have, however, been a number of cases, particularly in the telephone industry, where reserves have been accumulated on a straight-line basis, of criticism of what was believed to be excessive reserves. The amounts in question have sometimes been 30 per cent or more of the total investment. If such criticism continues and becomes more definite, the futility of refined computations based upon useful life of different elements and corresponding percentages applied to investments therein becomes apparent. At least one commission has indicated that it would authorize the creation of a reserve amounting to 10 per cent of the rate base value of the property and would thereafter approve only sufficient appropriations to maintain such percentage. Such a limitation may provide suitable protection for a large, composite system, but would not be adequate for a property consisting of a few large or specialized units. Nor would it be safe in the absence of assurances that deductions for accrued depreciation would not be made in arriving at fair value.

It has frequently been asserted that under the straight-line method of appropriations a mature, stable property would accumulate an unused reserve amounting to approximately 50 per cent of the total investment. Few utility properties are thus stable, that is without growth, and because of growth, the accumulated reserve will actually be a smaller percentage. A few years ago the author made a mathematical analysis of retirement reserve accumulations under certain assumed conditions of uniformity of growth and characteristics of property elements. ("Public Utility Depreciation Accounting"; *The Journal of Land and Public Utility Economics,* October, 1926.) The results of this analysis showed that the ultimate accumulation indefinitely maintained by such a property would be not far from 40 per cent of the total investment, being somewhat greater for properties of slow growth and less for properties of rapid growth. Departures from such percentages were shown to be not radically different for actual conditions instead of the assumed ideal conditions.

Clearly, such reserves contributed by customers materially curtail the calls on the investing public for additional construction funds. If the major part of such reserves has no other practical use than as investment funds, it may be questioned whether the utilities are justified in forcing such investments from customers who might find investments of their own choosing more satisfactory or profitable.

A word may be said regarding the argument that each customer should pay for the property currently consumed in the rendering of his service regardless of the size of the reserve which may be thereby accumulated. This may conceivably be an ideal situation, but as a practical matter no system of rates so far devised has accomplished this purpose. It is well known that in most classes of utility business a large proportion of the customers fail to pay the full cost of their service, the deficiency being made up by other more profitable customers. The gas industry, as an illustration, has estimated that about one-third of its customers fail to pay their out-of-pocket costs. Another third fail to pay these costs plus full return on investment and retirement charges. The remaining third make up the deficit if the company is actually earning a fair return in addition to all other costs. On electric railways, the short-haul rider pays a part of the cost of the long-haul rider. Busy telephones pay a part of the cost of those infrequently used. Some customers may make up in busy months the costs which they fail to meet in dull months. Many rate schedules are deliberately designed to assess more or less than the full cost of service on certain classes of customers. As a matter of fact, under existing rate practice few, if any, customers pay exactly and regularly the cost of their own service. Furthermore, few customers are concerned as to whether such contributions as they may make for retirements are used toward meeting the full cost of presently retired property which they have used in the past, or as an annuity intended to retire at some future time a minor segment of existing facilities which is assumed to be devoted to their particular service.

If or to the extent that full cost is not currently paid by utility customers, what items are specifically omitted? Obviously not fuel, payroll, taxes, interest, and other payments which must be currently made. The deficiency is either in dividends or retirement appropriations or other factors which are not necessarily uniform. Some approach to regularity is desirable in dividends but is less necessary in the retirement factor, which is a provision for an event that may occur ten or twenty years in the future.

Until the time arrives when utility companies have so radically modified their systems of rates that all classes of customers or even individual customers are charged the approximate cost of their service, including the so-called "property consumed" therein, great refinement in the system of accumulating retirement reserves is illogical. In the long run rate schedules are adjusted up or down to meet varying costs of service. At intervals there are gains above or losses below the cost of service, and some element in that cost is not currently recovered. It is logical that this should be the retirement factor which, as already steated, is least definite, and, therefore, that retirement appropriations within the limits heretofore indicated should be flexible.

Retirement Funds

It has been the practice of some regulatory commissions to require not only the accumulation of adequate reserves through the charges under discussion but also the setting up of corresponding distinct funds among the utility's assets. In a few cases it has been required that such funds be invested in government obligations or other securities having trust characteristics. In most cases the income from such investments has been added to the fund. This segregation is based on the belief that the funds in question should be held in trust to insure the stability of the property and safeguarded as are other trust funds. Furthermore, if the investment is in readily negotiable securities, there would never be any question regarding the obtaining of cash with which to acquire new substitute property.

The objection to this procedure is that the yield from trust funds is low as compared with the return from investment in the utility's own property. The difference between the two yields, which is a definite loss in income, must be made up by correspondingly higher rates. The trust investment theory, therefore, rests on the assumption that investment in the utility itself involves such risks that customers are warranted in paying higher rates in order to safeguard the property devoted to their service. Such an assumption is inconsistent with our established principles of regulation under which the commissions, so far as it is economically possible, are expected to safeguard the revenues and credit of the utilities in the same way that they protect the interests of customers. If under reasonable rates a utility is able continuously to earn 8 per cent on its investment, it would seem an unwarranted sacrifice to accept a return of only half that amount from investment in government bonds merely for added security.

Only a few commissions have prescribed the practice in question. The general practice permits the mingling cash from which retirement reserves are originally created, with other cash assets of the company, and the use of this cash for any corporate purposes. It is possible that, coincident with important retirements, the necessary cash for the purchase of substitute new units may not be available. If, however, retirement funds in substantial amount have been invested in uncapitalized property, securities may be sold against such property and the necessary cash provided. If it should also happen that the company lacks the credit necessary for new financing, the situation would be embarrassing unless the retirements in question could be postponed. Such lack of credit might be due to failure of a commission to recognize its full regulatory obligations which is certainly not a valid reason for restrictive measures relating to retirement assets. Such unfavorable coincidences as are here assumed have not commonly occurred, and, on the whole, the present prevailing practice of not setting aside distinct funds seems to be justified by its results.

Annual Reports

The responsibility already referred to, attaching to the exercise of judgment in fixing equitable standards of flexibility, cannot be over-emphasized. Further action is needed than has commonly been taken by utility executives in formulating a definite retirement policy, the lack of which is criticized by adherents to the uniform straight-line system. Nearly all utilities make annual reports to their State or other regulatory bodies, in which are included statements of retirement appropriations. If these appropriations vary substantially from year to year under a policy of flexibility, a clear explanation of the reasons should be given in the reports. Subnormal or supernormal amounts should be so indicated, preferably with a clear statement of the goal of accumulation or other standard in effect and the period of years within which reconciliation is normally to be expected—all in accordance with earlier recommendations herein. In such a way controversy may be avoided in rate cases over normal retirement needs, and the criticism referred to will be answered. The commissions might well require that such explanatory statements be included in all annual reports, and they might also concern themselves with the fidelity with which stated policies were made effective over a period of years.

It has been claimed that a flexible system of retirements encourages scant attention in the immature years of a property, which must be made up through excessive charges in a later assumed period of decline following years of normal balance. Such reasoning, however applicable it may be to a typical industrial property, does not fit the normal utility which must grow without time limitations, constantly adding new elements and abandoning old ones, with no period when the property as a whole is new, mature, or old.

A Court Decision

An interesting case involving a novel interpretation of retirement provisions has recently been adjudicated. The United Railways and Electric Company of Baltimore applied to the Maryland Commission for an increase in fares. It included among its cost elements a depreciation annuity sufficient to retire property elements at their rate base value rather than their ledger value or cost. The latter practice has been customary and, in fact, prescribed by standard accounting systems. The company contended that the former method should be adopted in fixing fares, for the reason that the rate base value fixed by the Commission in an earlier proceeding was higher than the ledger value of many constituent elements, and that if elements installed years ago at prices substantially below those included in the rate base were now replaced at higher cost, the company's investment would be increased, but its rate base would remain unchanged. This process, if continued for a period of years until all pre-war property had been retired, would mean an increase of millions in investment, but no increase in revenue, assuming that the level of prices on which the rate base value was fixed remained unchanged. Without an increase in revenue, the company contended, it could not secure additional investment funds and was faced with deterioration of property and financial disaster.

The Commission refused to accept this contention and continued in substance a previous much smaller allowance for depreciation, which, incidentally, was a percentage of gross earnings. The company appealed to the Maryland Court of Appeals, and in a decision rendered July 16, 1928, its contention was sustained. In conformity with this decision, the Commission subsequently increased its depreciation allowance by about 85 per cent. The court in its decision used the following unmistakable language:

> To require the Company to sell its service at rates which made no provision at all for the replacement or repair of the property when worn out or obsolete, would be plain confiscation, and to require it to sell it at rates which make an inadequate provision for the return of its value, when worn out or obsolete as a result of public service, can be no less.
>
> Counsel for the Commission suggests that to restore value would be to "require the financing of additions to plant, to the extent of the excess of replacement over original cost of property replaced, by the public, which would in turn have to pay a return on the capital thus required." The meaning of that suggestion is not altogether clear, but if it is that the Company is entitled to the return of anything less than the value of its property it cannot be sustained. Money deducted from earnings to replace equipment which has become worn out or obsolete, by other equipment of the same character and the same value, adds nothing to the Company's resources but merely keeps them at the same level.

The Commission, while accepting the ruling of the highest court of its State as above indicated, has not been convinced of its equity and has appealed to the Supreme Court of the United States for review. A writ of certiorari has been granted and a final authoritative ruling on the matter is expected within a few months.

While from an accounting point of view this decision may appear confusing, as a matter of fact it does not disturb fixed capital accounting because retired property may still be removed therefrom at its recorded value and the succeeding property entered at its actual cost. Although the ledger value may thereby continue to increase, the rate base value maintained in separate subsidiary accounts will not vary other than through changes in price level. The increase in cost and ledger value is provided for through the increased retirement appropriations and not from new capital.

In any event, where a rate base differing from fixed capital account has been established by a commission, a continuous record thereof should presumably be kept in order to maintain up-to-date values. The depreciation accounting program in question merely enlarges the purpose of this subsidiary valuation record, which, to be definitely useful, must, of course, be in sufficient detail to identify the value of each element to be retired.

Financial Advertising

One other situation in which accountants are interested should be mentioned. The financial statements published by many public utilities in connection with advertising of security issues and otherwise are commonly lacking in uniformity, particularly with respect to retirement or depreciation charges. Published income statements sometimes include such charges in operating expenses with or without designation of this fact and the amount; others insert them as deductions from income; and still others fail to designate any provisions for such purposes in their published statements.

Unless the amount of depreciation charges, regardless of where they appear in the income statement, is known and the balance sheet shows the accumulated reserves, the advisability of investment in an advertised security cannot be clearly determined. The practice is growing in utility circles of an income statement set-up in which the net income remaining after payment of operating expenses, taxes, and interest charges is added to the accumulated surplus, from which dividends and retirement appropriations are taken. This is a logical practice, at any rate where income is so subject to fluctuation that dividends or depreciation charges are not at times currently earned in full. So long as the State system of accounts permits and even encourages retirement appropriations from surplus, and this system continues in effect for the major part of the utility business, it would seem preferable to standardize published income statements accordingly.

Results of Accounting Standards

Neither of the two accounting systems, for depreciation and retirements respectively, have been in regular use long enough to permit an accurate survey of their effectiveness. The Interstate system has nominally been applied by steam railroads to rolling stock for a considerable period of years. Their practice has varied widely and there has been an obvious lack of enthusiasm on the part of railroad executives in making the system effective and definite opposition to its extension to other classes of railroad property. Only a few electric railways, engaged in interstate commerce, have applied this system to their equipment, with objection to its burdensome cost and inaccuracies and opposition to its more extended use. The State commissions have rarely enforced the depreciation requirements of the interstate system as they have applied it to intrastate operations.

The telephone companies generally throughout the United States have adopted the straight-line system, have used it successfully for a period of years, have accumulated very extensive useful life data which they believe to be reliable, and are heartily in favor of the refinements in effect and contemplated. The distinctive character of the telephone business, the unusual value of its service in relation to rates, ability to control retirements for non-physical causes and to find further uses for retired equipment, and other special advantages distinguish the telephone industry sharply from other utilities and render its experience of uncertain value to others.

The State retirement system has been in effect, increasingly, only since 1922. Obviously this period is too short for accurate judgment as to its effectiveness. The reaction from its users has, however, been favorable. It should be noted that this system is new only with respect to its standardization and official indorsement. It is, in substance, the system most commonly used since the origin of depreciation accounting. Where it has been consistently used it has promoted stability of business and credit, expansion of facilities, and community development. This system, therefore, may claim for itself demonstrated success, based upon long practical experience with its essentials. In this era of emphasis on good public relations between utilities and the communities served leadership in good citizenship is

(Continued on Page 663)

The Flexible Cord Problem

As Viewed by the Electric Lighting Company

By ARTHUR P. GOOD

FLEXIBLE cords will continue to be used for conducting electricity as long as they offer to the user the convenience that they do today in supplying energy to electrical appliances, both motorized and non-motorized, and for electric lighting purposes.

A difficulty that seems to have been encountered through the use of flexible cord is the use of so-called substandard cord. I understand the term substandard, as applying to flexible cord, to mean that the insulation, that is the rubber insulation over the copper conductor, is very thin and of poor quality.

A second difficulty is the use of cord as line wire. In other words, cord is stapled to walls and base-boards, and run under carpets to supply electric energy between a fixture socket or a convenience outlet and a too far distant appliance.

As I understand it the chief duty of the members of the International Association of Electrical Inspectors is to guard the life and property of the citizens against mishaps occurring from the use of improper electrical appliances and electrical material.

Therefore, in viewing any specific one of your problems, it would seem fitting to determine just how hazardous from a fire or life standpoint is the particular material or appliance, or method of installation under discussion.

IT was felt that a record of five years of electrical fires and fatal electrical accidents occurring in the city of Chicago from the use of flexible cord might serve as a cross-section of the situation and give us some idea of just how hazardous these cords are. I give you here this five year record.

A recent survey indicates that 96 per cent of the 790,000 homes of Chicago are wired for electricity. The estimated population of these homes is 3,033,600 based on a total population of 3,250,000.

It would seem conservative to estimate that 50 per cent of these homes have flexible cord installed, which is either substandard or the installation of the cord is not in accordance with the electrical code.

On this basis there are 379,200 homes exposed to the fire hazard, which is considered to be present on account of defective cord conditions. Exposed to possible life hazards in connection with the cord in these homes are 1,516,800 persons.

Mr. Good is Chief Inspector for the Commonwealth Edison Company, Chicago, and Chairman of the Wiring Sales Committee, Commercial National Section, N. E. L. A. This paper was read on July 29th before the Convention of the Western Section, International Association of Electrical Inspectors, held at Detroit

Let us now look back to our five-year record of electrical fires and fatal accidents attributed to defective cord conditions. For the five years, beginning 1924 and ending with the year 1928, there occurred in Chicago 353 fires attributed to flexible cord. The total number of electrical fires over this same period was 2288. Therefore, the cord fires are some 15 per cent of the total electrical fires. The data available does not indicate where the cord fires occurred but it is safe to assume that at least 50 per cent, and perhaps more, of them occurred in commercial or industrial establishments.

During this same five-year period, there were three fatal electrical accidents which could be attributed to flexible cord. The total fatal accidents that occurred during this period were 77. The flexible cord fatalities were, therefore, something less than four per cent of the total fatalities. Of the three fatal accidents occurring over a period of five years, only one occurred in a home. In none of these accidents was the cord used as line wire, that is, stapled or permanently fastened to the building structure. In all cases, it was being used purely as a portable cord. The only statement that is made regarding the cord in connection with these accidents was that the cord was in a defective condition, therefore we cannot assume that the cord was substandard. It may just as likely have been a standard piece of flexible cord which through usage had become abraded, exposing the copper wire.

Considering the fact that these three accidents occurred over the long period of five years in a city with a population of 3,250,000 persons, and further considering the fact that it could not be established that the cord, itself, when new, was defective, in other words—substandard—it would seem that from a life hazard standpoint cord accidents could be considered negligible.

ASSUMING, as stated above, that one-half of the electrical cord fires over the 5-year period could be attributed to use in the home, there occurred in the 758,400 wired homes in Chicago, 175 fires attributed to the use of flexible cord. Of this number 20 per cent is due to cord troubles other than substandard material or cord used as line wire. The annual percentage, if we may speak of it in this way, in homes exposed to cord fires is something like 9/1000ths of one per cent. In these 379,200 exposed homes, there are housed, as given above, some 3,033,500 persons. Considering the fact that a very appreciable percentage of this number of persons must, at least, occasionally, handle and perhaps frequently abuse the flexible cord installed in their homes, is it not a very excellent record for these cords that such an infinitesimal number of fires are annually occurring from them in the city of Chicago, and cannot we assume that these Chicago data give a cross-section picture of the situation throughout the United States? I, in no way, desire from this statement or the figures submitted, to attempt to brush aside as of no consequence the fires and the deaths that have occurred through the use of flexible cord, but I do think that our old bugaboo "Apprehension," is again at work in connection with the flexible cord situation. Indeed, I believe that if it was a matter of great moment, the citizens of our cities and towns throughout the United States would be the first ones to be concerned. I have noticed when any agency works toward the destruction of the citizen's life or his home, he immediately rises up and attempts to do everything in his power to bring about corrective measures. I cannot feel that he is at all alarmed by the comparatively few deaths and few fires that have occurred by the use of flexible cord in his home; otherwise he would not continue to be so little concerned as to the kind of cord which he purchases or the manner in which he installs it.

However, I do not want you to feel that the electric lighting companies are not doing what they can to lessen whatever hazards there may be in connection with the use of this material.

When I received word of what you would like me to talk about today, I immediately wrote a number of letters to various acquaintances of mine in the different utilities throughout the United States, asking them what measures they were taking to bring about the manufacture of better flexible cord and the proper use of such cord. I will give you excerpts from some of the replies that I received. Perhaps there is no better place to begin than by quoting from a letter from the very progressive lighting company of the city which is our host. "We are making quite a serious effort to put adequate wiring into new residences by education of contractors, builders and architects. Our city rules require a convenience outlet for every fifteen feet of gross wall space in living-room, and one every twenty feet in all other rooms other than closets and halls."

HERE is one from Massachusetts with regard to flexible cord and cord sets:

"We endeavor to use and sell only those which have the underwriters' approval."

Here is one from Philadelphia concerning the two problems of the use of substandard cord and the promiscuous use of flexible cord in place of approved circuit wiring:

"I find that our company has taken definite steps in contacting with the jobbers and dealers and our local Electric Club to secure their assistance along these lines. Our company is selling cords at cost, as an incentive to prevent the use of substandard material."

Here is one from the biggest lighting company in the State of New Jersey:

"We have persistently refused to sell appliances that have substandard cords and plugs unless the cords and plugs were changed. When we took on the sale of a well-known and widely advertised make of electric flat iron, we required the manufacturer to supply us with a cord and plug in accordance with our specifications, which demanded a cord quite different from the cord regularly supplied with the iron."

I think most of you know about the efforts that have been made in New York City to have electrical dealers and department stores unite in refusing to market substandard flexible cords.

Officials of these concerns and department store managers were interviewed and told about the hazards in connection with the use of this material. These educational efforts were made by representatives of the underwriters and the electric lighting companies.

I could give you comments from a number of other letters that I received from electric lighting companies, but every one of them is along the same line, namely, that they are doing what they can to cooperate in this situation through education of contractors, builders, and architects; through conferences with electric dealers and department managers of stores which handle electrical merchandise.

SOME of these letters state that they would be willing to make efforts, but that they are at a loss to know just what to do to prevent the use of the wrong kind of cord and to prevent the employing of cord in the wrong manner.

I feel, from comments I have heard, that the results of conferences arranged to try to educate or persuade dealers and department store people and other concerns from handling substandard cords are not entirely successful. In some cities where this has been tried, it has been found, in spite of continuous effort, to be rather a failure, for as long as someone sells this substandard material, others feel that to compete they also must sell it, and the result is, that the individual or firm that wants to go alone and not market this material is penalized, and loses in consequence a certain amount of business.

Electrically, from time to time, we condemn the five and ten cent stores for selling the wrong kind of a flat iron or a waffle iron, or a toaster and for marketing electrical materials which are stated to be flimsy in their construction.

All of these wiring jobs that we have done since June, 1928, have been installed by using non-metallic sheathed cable. We have installed 30,356 outlets up to date. This wiring business amounted in money to $180,000. When we called on the householder to install or estimate in connection with additional convenience outlets, other items generally occurred to him, necessitating, in addition to the convenience outlets, other wiring and fixture installations. On this additional "picked-up work," as you might call it, there has been a total of $74,597 in wiring and $28,288 in fixtures over a period of fifteen months. The total amount of dollars received for this work was $282,885, a very large portion of which was received by the electrical contractors of Chicago, who installed this work. Electrical labor also received its full share, to the amount of some $200,000 paid to the wiremen by the contractors.

THE users of electricity who had these additional conveniences installed are now enabled at a very reasonable expense to have their homes better lighted, and to use more appliances, and to use them more conveniently.

Not taking into consideration the additional appliances which we know have been purchased by those who had these outlets and other wiring installed, we estimate that the additional income to us over a period of fifteen months from the use of electricity on this new wiring amounts to some $33,750. All concerned have profited, and we maintain that our customers have a safe and permanent wiring installation through the use of this less expensive wiring material. We may safely say that if this economical material had not been available, the Commonwealth Edison Company would not have conducted the campaign that was conducted, and the result would have been that a number of our customers would not now have the convenience of some 30,000 additional outlets and the wire manufacturer, the fixture manufacturer, the electrical contractor, the electrical worker, and the electrical lighting company would be together some $316,600 poorer, and the citizen who had this work installed would, in the meantime, have gone down to the five and ten cent store, bought and installed 25 feet of substandard flexible cord from a multiple plug sticking out of the one convenience outlet in his living-room, tacked it along the baseboard by driving an upholster tack between the two flexible wires and thence under the carpet, 25 feet to the new radio set.

I personally have purchased sockets, plugs, flexible cords and other materials in the five and ten cent store, and why did I purchase them? Because I could get them at what I considered was a reasonable price, and because this material was convenient for me to use in my home in connection with my electrical installation.

I think in place of condemning the five and ten cent stores, they deserve a lot of credit by providing economical materials and through the use of these materials encouraging the growth of the use of electricity. At least, this is the way that the electric lighting companies feel about it, and here we have to my mind the keynote of the whole situation.

The American citizen will continue to use in his factory, in his shop, in his home any appliance and any material which he can purchase at what he considers a reasonable price and which he can easily install.

As long as this citizen can economically purchase and easily install flexible cord, he will continue to buy and wire his home in an improper way with this cord, and as long as there is a demand for the cord, you will always have such competition in the manufacture and sale of it, as will bring on the market the so-called substandard type, and quite naturally the purchaser will buy such cord and will use it. If, therefore, you really desire to hit the substandard cord below the belt and to not make it worth the time and energy of the citizen to use such cord as line wire, then you must give him a substitute. Give him less expensive standard wiring material that he may either install himself, in a proper manner, or if he elects to have it installed, he can have such an installation made at a reasonable expense. If you wish to educate the citizen in what he must not do, or what he must use or must not use in his electrical life, then do everything that you can to popularize the use of electricity. A wider and wider use of electricity will in itself prove of inestimable educational value.

THE extended use and the ever extending use of appliances have done more than any other factor to put the citizen in a frame of mind where he is no longer afraid of electricity but at the same time understands its possible hazards. Radio, today, has greatly helped to accomplish this very thing, and other immensely popular usages of electricity will be with us in ever increasing numbers in the future.

The electric lighting company, due to its ever increasingly close contact with the public, believes itself in a unique position as far as sensing the electrical desires of its customers. We believe that the householder wants the rooms of his home properly and well-lighted. He wants to have many switch outlets so as to easily and conveniently control such lighting. He desires to use many appliances, and if he is to use them conveniently he must have outlets so installed that there will be no incentive on his part to go to the much maligned five and ten cent store. He has no desire to endanger the lives of his family or to burn down his house. He does not want dangerous or so-called cheap electrical material, neither does any one want or advocate the use of such material who has at all, today, any interest in the electrical business. It is the duty of you men to see that he does not use or install dangerous electrical material, but please watch out and do not let the old bugaboo called "Apprehension" so dictate your policy that you are unwilling to step side by side with the other great advances being made in the electric art, and by so doing, not permit the use of more economical wiring materials and methods of installation, except through such restrictive measures as render the use of such material and installation practically abortive. In other words, give the user of electricity a reasonably priced, good wiring material. Show him how to properly install this material, and experience has shown that he will buy it and will use it properly, and will no longer feel the need of using the wrong kind of material or improperly installing it. Please understand that when I have referred to the home use of electricity, that exactly the same statements would apply to its use in the factory or in the store.

The Commonwealth Edison Company of Chicago so strongly felt that this idea was a keynote one, that we have since June, 1928, conducted a wiring campaign throughout Chicago in connection with residential occupancies. The electric lighting companies have consistently advocated the use of economical wiring material, such as non-metallic sheathed cable and thin wall conduit or so-called electrical metallic tubing.

In a broadminded manner, the Department of Gas and Electricity of the City of Chicago is permitting the use of non-metallic sheathed cable, and since June, 1928, the Commonwealth Edison Company has conducted a home-wiring campaign for more convenience outlets. We have advertised this campaign through newspapers, on billboards, through small folders being inclosed with the monthly bills to the consumer, in fact in every conceivable way we have advocated more and many additional convenience outlets. We do not do the actual wiring; we solicit the business, take the order, finance it, but the electrical contractors of Chicago actually do the work and are promptly paid for it upon its completion.

The users of electricity who had these additional conveniences installed are now enabled at a very reasonable expense to have their homes better lighted, and to use more appliances, and to use them more conveniently.

NOT taking into consideration the additional appliances which we know have been purchased by those who had these outlets and other wiring installed, we estimate that the additional income to us over a period of fifteen months from the use of electricity on this new wiring amounts to some $33,750. All concerned have profited, and we maintain that our customers have a safe and permanent wiring installation through the use of this less expensive wiring material. We may safely say that if this economical material had not been available, the Commonwealth Edison Company would not have conducted the campaign that was conducted and the result would have been that a number of our customers would not now have the convenience of some 30,000 additional outlets and the wire manufacturer, the fixture manufacturer, the electrical contractor, the electrical worker, and the electrical light company would be together some $316,600 poorer, and the citizen who had this work installed would, in the meantime, have gone down to the five and ten cent store, bought and installed 25 feet of substandard flexible cord from a multiple plug sticking out of the one convenience outlet in his living room, tacked it along the baseboard by driving an upholster tack between the two flexible wires and thence under the carpet, 25 feet to the new radio set.

Depreciation Accounting Methods for Public Utilities

(Continued from page 660)

of outstanding importance, and any factor tending to promote rather than retard progress should not be ignored.

Conclusion

The two accounting systems discussed herein are alike to the extent that they seek to stabilze certain costs over a period of years. The costs in question are, however, quite different, one including only depreciation, the other embracing the over-all cost of service, in which retirement charges are an important stablilizing factor. The reserves which both systems provide are usually quite different in size, but even if they were the same, the methods of accumulation are unlike, being uniform and flexible respectively. This is the essential difference. Each system is open to objections in its operation. The Interstate depreciation system is based on assumption as to useful life, which the outstanding executive and technical talent in the industry believes to be untenable now and to continue so until engineering and economic developments have become stabilized beyond present expectations. The State retirement system is vulnerable in its flexibility, which, without wise supervision, may be carried to unsafe extremes. But this defect can be remedied by some definite program of systematic flexibility such as is suggested herein. As between two systems with defects which are for the time being uncorrectible and correctible respectively, the choice should be obvious.

A Friendly Neighbor in a Time of Need

A Power Company Provides Water for a Drought Suffering Section

By J. B. MAHONEY

Superintendent of Power, New England Power Company

OWING to the unusual drought experienced in New England throughout the past several months, the water storage supplying the Shelburne Falls Fire District, so called, became very serious. The Shelburne Falls Fire District is a corporation made up of the thickly populated portions of the towns of Shelburne and Buckland, Mass., and under conditions existing during a normal year, the water supply is unexcelled, it being secured from the Fox Brook located in the hills just north of the community and giving a static head of approximately 300 feet. It was first put in operation about 1911, and in the succeeding eighteen years has been ample for the villages.

During the months of May, June, July and August, 1928, an average rainfall per month of 5.39 inches fell. During the same period in 1929, however, the precipitation dropped off to an average of 1.84 per month, or approximately 34 per cent of the rainfall of 1928. The sixty-year average for the same four months was 3.93 inches, according to records available, being over 50 per cent greater during the sixty-year period than was experienced the present season.

AS a result of this unusual shortage in precipitation, the storage in the Shelburne Falls reservoir began to get serious the latter part of July and the first of August. The residents were warned to be as economical in the use of water as possible and were restricted to the use of water for anything but absolute essentials. The watering of lawns and gardens as well as washing of automobiles and other vehicles were absolutely forbidden. Even with this curtailment the situation became more serious daily, and by the second week in August the shortage became so acute it was deemed advisable to notify the State Board of Health of the situation. A couple of representatives from the State Board visited Shelburne Falls on August 15 to investigate the situation and determine whether or not some other source of water could not be secured immediately to temporarily alleviate the situation. After going over the grounds they found the only available water was in the Deerfield River, and owing to the fact the north branch of the Deerfield which empties into the main river at Shelburne Falls was very low and badly contaminated by sewage from the villages of Jacksonville, Colrain, Griswoldville and Shattuckville, it was unfit for use in the immediate vicinity of Shelburne Falls and Buckland. Their attention was called to the fact that our No. 4 Hydro-Electric installation made use of a tunnel, the intake of which tapped the Deerfield River above the mouth of the North River, and if the New England Power Company would give its consent to secure a supply from one of its penstocks at No. 4 Station, a satisfactory source of pure water would be available.

THE State officials, together with representatives of the Shelburne Falls Fire District, got into immediate touch with the writer and asked if such a plan would be possible and feasible. This was the first knowledge we had of the situation being so acute and we assured the officials that the New England Power Company would be only too glad to do anything within its power to render assistance.

The writer went over the situation in person and ascertained it would be possible to use a 3-inch existing connection from one of our turbines under a head of approximately 65 feet for pumping to the town water mains and reservoirs. Later on the officials experienced difficulty in securing a proper pump and, upon being advised of the trouble they were having, we immediately made arrangements to send a two-stage 100 hp. 4-inch pump from our plant at Bellows Falls, Vt. The request first came to the New England Power Company about 4 p. m., and by late evening we had transported the pump from Bellows Falls and set it up at No. 4 Station, and by noon of the following day it was fully connected, ready for service. In the meantime, the water commissioners had purchased sufficient pipe to extend across the Deerfield River from No. 4 Station and tap the water main which extends along the Shelburne Falls-Colrain highway. Considerable time was being lost in installing this pipe, so the New England Power Company again threw in its organization to rush the installation of the pipe, and about 4 p. m. of August 16, or twenty-four hours after the emergency was first made known to us, we had transported a complete pumping plant and were delivering about 300 gallons per minute, or at the rate of approximately 400,000 gallons per day, to the community. The average daily water consumption of the community is approximately 150,000 gallons, so that we are not only supplying the normal consumption, but storing considerable in the reservoir as well; in fact, within six hours from the commencement of pumping we had raised the water level in the reservoir some 50 inches. The water has been analyzed by State chemists and found to be pure and fully satisfactory for drinking purposes. The chlorinating process is an additional precaution, considered advisable by the State Board of Health.

A FEW days after the pump was installed and the local officials had a demonstration of its capacity and dependability, all restrictions on the use of water in the community were lifted. As matters now stand, the community has, in effect, a modern pumping station capable of delivering approximately 300 per cent more water than its daily consumption, completely housed in a modern power station with constant attendance at absolutely no investment cost.

It is interesting to note that within the short space of three years this community has passed through two emergencies, brought about by the elements, and on each occasion the New England Power Company has brought it through without loss to property, life or health.

Were it not for the trained organization the New England Power Company maintain at Shelburne Falls, the knowledge, ability and willingness to serve as well as the resources of the New England Power Company this community would have, without doubt, been wiped out of existence during the floods of 1927, and today would be in a most precarious situation owing to the fact there is no other water supply available at the present time, aside from that in the Deerfield River, which all comes from the storage waters impounded by our storage dams on the upper Deerfield.

National Executive Committee Meeting

The 1930 N. E. L. A. Convention Will Be Held in San Francisco

A DEFINITE decision to hold the 53rd Convention of the National Electric Light Association at San Francisco the week of June 16, 1930, was reached at the first Executive Committee meeting of the administrative year held at Chicago, Sept. 25. The Convention will be held in the San Francisco Exposition Auditorium.

The selection of the convention place and date, the consideration and approval of the association's budget for the current administrative year and reports from the four National Section Chairmen, Geographic Division representatives and Special National committees was the chief business of the meeting at which Chairman M. S. Sloan presided.

The National Executive Committee meeting followed meetings held by the Women's Committee, the Executive Committee, Accounting National Section and the Customer Ownership Committee on Sept. 23, and meetings of the Executive Committee, Public Relations National Section and the Insurance Committee on Sept. 24.

The treasurer's report and the budget for the current year were presented to the Executive Committee by Secretary Marshall in the absence of Treasurer P. S. Young. The treasurer's report, which showed the finances of the Association to be in a satisfactory condition, was approved as presented, as was the budget after some discussion and revision.

Secretary Marshall reported that the total membership of the Association as of Sept. 20 was 21,626, a net increase of 848 since the report of May 29.

In reporting to the committee, Managing Director Clapp said in part: "This year we have made a decided step forward in the matter of the personnel of committees, at the suggestion of Mr. Sloan. In March we approached executives of the member companies, sending a letter inclosing a list of the various committees upon which members were desired, with a request that they indicate those men they wished to have serve on the respective committees. The point of view back of this procedure is that the executive knows his personnel and knows the line of development and present situation, and that he is the one to indicate the members to serve. We were gratified with the large response this method secured from executives, and are confident that it has resulted in a stronger, more authoritative and enthusiastic group in the personnel of the organization than ever before."

Mr. Clapp also reported that the rebuttal case on behalf of the Association had been prepared for presentation to the Federal Trade Commission. Due to the illness of Judge Healy, counsel for the Commission, it is probable that it will be the first of the year before the rebuttal case can be presented.

Geographic Divisions

Representatives from the several Geographic Divisions reported that divisional work is fully organized and is proceeding in fine fashion. Several of the divisions brought out in particular that rural electrification is progressing rapidly, and that plans for the celebration of Light's Golden Jubilee are being widely made.

J. F. Ford, reporting for the Pennsylvania Electric Association in the absence of President F. R. Phillips, stated that electric service was extended in 1928 to 20,000 rural customers in Pennsylvania at an expenditure of over $3,000,000. L. H. Herrington, president of the East Central Division, reported that conditions in the industry in his division are getting better every day in all respects.

G. C. Neff, president of the Great Lakes Division, said that 90,000 farms in his division are connected to central station at this time. In 1923 there were 15,000. Committees of the division are cooperating in the celebration of Light's Golden Jubilee and are doing their best to give a good account of themselves. A food preservation program has been planned, and the Commercial Section has planned a lamp campaign. He also reported that the constitution of the Great Lakes Division has been revised to accord with the constitution of the N. E. L. A.

A. E. Bettis, President of the Middle West Division, gave a comprehensive summary of the plans for the various committees of his division. C. H. Hodskinson, President of the New England Division, and T. T. Parker, President of the North Central Division, both reported their organizations in fine shape and assured the support of all national programs.

M. L. Hibbard, President of the Northwest Division, told of the success in Washington, Oregon, Utah, Montana and Idaho of electric water heating and electric cooking. He also requested that the National Association cooperate in solving the problem of radio interference. Managing Director Clapp replied that provisions had been made in the budget for an investigation of this problem and that it was hoped that the solution would be found applicable in other sections of the country.

E. B. Criddle of the Pacific Coast Division reported that work is progressing favorably in all activities of his division. In referring to rural electrification, he stated that "during the last year we published what we believe to be a very valuable book on farm electrification. As, in our division, the wide scope of territory includes farms from mountain to desert, it covers rural electrification from the broadest possible standpoint. Our goal is to have every farmer use every type of electrical service possible on the farm, which includes, of course, the farm home. We hope to have farm homes as completely electrified as other homes."

O. A. Weller, secretary of the Rocky Mountain Division, T. H. Tutwiler, President of the Southeastern Division, and Fred W. Insull, President of the Southwestern Division, report excellent work being done in their divisions.

National Sections

Harry Reid, Chairman of the Public Relations National Section, reported that all meetings of committees in his section had been very successful and that the organization of the section is complete. He spoke particularly of the National Public Speaking Contest under the direction of the Public Speaking Committee, and asked for its hearty support.

Marshall E. Sampsell, Chairman of the Commercial National Section, reported that the Rate Committee of his section has been eliminated and that two representatives of the Commercial Section will serve on the Rate Research Committee instead. All indications point to greatly increased activity in the commercal field.

W. R. Emerson of the Accounting National Section reported that many new activities suggested by last year's reports will be taken up by the several committees of the Accounting Section.

A. D. Bailey of the Engineering National Section reported that the section is functioning completely. Group meetings will be held shortly, serial reports and other activities of the section are being turned out regularly by the various committees.

Electrification of Steam Railroad Committee

Chairman Budd of this committee told of the excellent work accomplished last year by this committee and discussed plans for the current year. The question of a paid full-time secretary for this committee was raised. Action was deferred on this question until the matter has been placed before the Public Policy Committee.

Prize Awards Committee

Chairman Onken reported that this committee is giving serious consideration to all awards administered by the Association and that it was felt that it would be opportune to place these awards on a higher, broader and more stable basis. Towards this end he offered the following suggestions:

"1. Funds to provide for such awards should be placed in trust to assure availability from year to year.

"2. Such awards should be effective for a stated period of years or for such period as the trust is definitely established.

"3. A committee should be provided.

"4. This committee of the Executive Committee should confer with the donors.

These suggestions were approved.

Civic Development Committee

Chairman Reynolds reported that with the completion of the report of migration and change of industry made jointly by the Metropolitan Life Insurance Company and the committee, the committee finds itself able to devote more time to the fundamentals of its activities. Work contemplated by the committee include a study of the results of the civic activities of the companies which have had a long successful career in industrial development. Other work will be the preparation of a report which will tell how local companies may tie themselves in with civic activities, including industrial activities of their communities.

Educational Committee

Chairman Jenkins reports that the committee has just completed an extensive program in the revision of home study courses. An advanced accounting course, which had been in preparation for a year or more, has been made available to students. During the summer the course in practical electricity was completed and the committee is now ready to take up the revision of the commercial course. He reported that during the past year there has been an increase of 54 per cent in sales of home study courses over previous years.

Rural Electric Service Committee

Chairman Holcomb referred to the work that is being done on the national project located near Washington. It is thought this work, the chairman stated, will rapidly develop into something of great importance in the matter of rural electrification. The activities of this project will be national in scope. Work will be carried on there that cannot be accomplished in State projects.

The invitation to hold the 1930 convention in San Francisco was extended by J. P. Coghlan and was seconded by Mr. Criddle, President of the Pacific Coast Division.

Sixteen applications for Insull Medals for resuscitation by the prone pressure method were approved. These were as follows:

Leo Nedvidek, General Electric Co., Schenectady, N. Y.

George T. Tomlinson, Consumers Power Co., Jackson, Mich.

Wm. F. Meier, Illinois Power and Light Corp., East St. Louis, Ill.

Joseph Clyde Heaslet, San Joaquin Light and Power Corp., Fresno, Cal.

W. T. Bussell, Southern Sierras Power Co., Riverside, Cal.

Harry W. Hennen, Union Gas and Electric Co., Cincinnati, Ohio.

Otto Olson, Michigan Public Service Co., Sheboygan, Mich.

Alta L. Crawford, Illinois Power and Light Corp., Eldorado, Ill.

Francis Benson, Wisconsin Power and Light Co., Monroe, Wis.

Edward Larnce Brasel, Central Illinois Public Service Co., Springfield, Ill.

Bruno Manel, General Electric Co., Pittsfield, Mass.

Leonard Klausser, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

E. M. Wiseman, Los Angeles Gas and Electric Corp., Los Angeles, Cal.

First Aid Team, Line Department, Southern Colorado Power Co., Pueblo, Colo.

A resolution on the death of the late Harry M. Edwards of the New York Edison Company was passed by the Committee. The resolution follows:

"WHEREAS, the National Executive Committee of the National Electric Light Association at its meeting in Chicago, Ill., on Wednesday, Sept. 25, 1929, has learned with profound regret of the death of H. M. Edwards, a member of the association since 1906, the first chairman of the Accounting National Section 1908-1909 and again chairman of the section for three years during the period 1913-1916, and a member of the National Executive Committee since 1924,

"NOW, THEREFORE, BE IT RESOLVED:

"THAT, by the death of H. M. Edwards the National Electric Light Association has lost one enthusiastic supporter and friend and one of its pioneers, who not only labored to fit himself for increased responsibility in the industry and with the New York Edison Company, of which he was vice-president, but also did much in advancing and perfecting the accounting and fiscal operations of electric light and power companies thus adding prestige to his company, the electric light and power industry and the National Electric Light Association, all of which he so faithfully served, be it

"FURTHER RESOLVED, that this expression of our sorrow and regret be incorporated in the minutes of this meeting and that a copy thereof be sent to the family of the deceased.

Henry M. Edwards

HENRY MOORE EDWARDS, vice-president of the New York Edison Company, in charge of the Accounting Department, died suddenly on the night of September 18 at his home, 42 Woodland Avenue, Glen Ridge, N. J.

Harry Edwards was spoken of as the Dean of the Accounting Section of the National Electric Light Association. He was largely responsible for its organization in 1908 as one of the distinct divisions of association work, and was its first chairman.

Mr. Edwards was born in New York City on July 28, 1860. He began his career in the electrical industry in 1889 as accountant with the Manhattan Electric Light and Power Company. In 1901 he handled the financial operations relative to the consolidations of all the companies forming the present New York Edison Company, and was the auditor from 1901 until 1924, when he was made vice-president, accounting, the title he held at the time of his death.

He was vice-president and director of the Yonkers Electric Light and Power Company; secretary, treasurer, and a director of the Edison Light and Power Installation Company. He was a member of the Accounting Advisory Committee of the system of five companies of which M. S. Sloan is president, and also a member of the Standardization Committee of these companies.

At the time of his death Mr. Edwards was a member of the Executive Committee of the National Electric Light Association, and was a member of several other important committees in the association. He was also a member of the New York Electrical Society, the New York Electrical League, the Academy of Political and Social Science, Chamber of Commerce of the State of New York, Merchants' Association of New York, and of the Edison Quarter Century Club.

Mr. Edwards was looked upon by the electrical industry as a wise counselor and willing cooperator. He was intimately concerned with the adoption of good accounting practices, the uniform classification of accounts and the development of utility rate systems. His wide experience in all branches of the industry gave him an understanding of the business that made him an extremely valuable committee worker, and his personality and disposition won him friendship and respect among a host of men. His life and work afford the highest example of an able utility executive devoted to his business and to the service it renders.

Service Suggestions

NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman,* Public Service Co. of Northern Illinois, Chicago, Ill.
To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 76 — October, 1929

"Pay Bills Here"

Of Interest to Public Utility Cashiers

By H. T. East

Assistant to Vice-President, Public Service Company of Northern Illinois, Chicago, Illinois

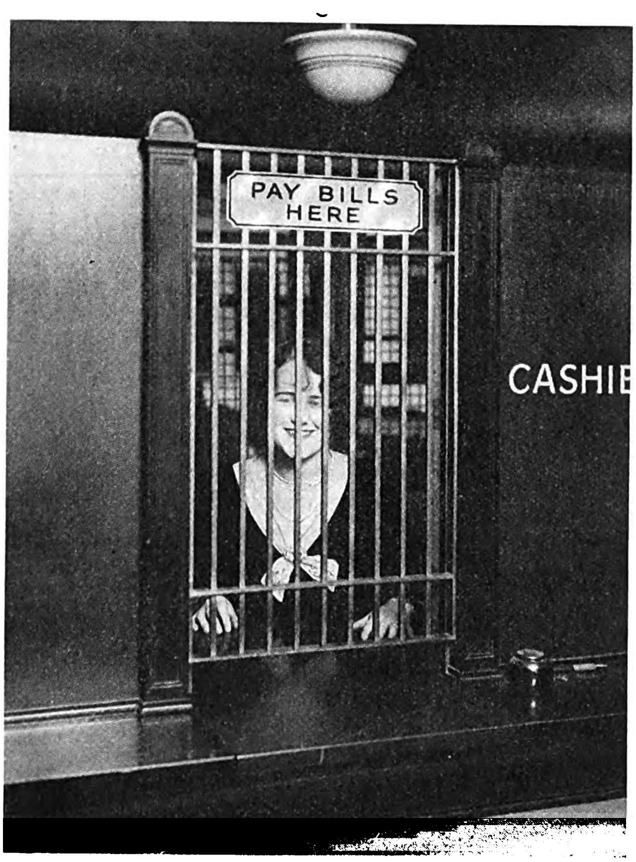
THE busiest, though not the largest or most finely appointed, drug store in an Illinois city prominently displayed this sign: "If the clerk fails to thank you for your patronage your purchase is free." The management meant it. If at any time any employee neglected to carry out the policy of the store, the patron was presented the article as a premium for the failure. Whether the management or delinquent clerk bore the burden I do not know, but it is certain that few occasions arose where the claim could be made. This innovation provided not merely a penalty for the establishment, but a constant reminder to patrons and store organization that every customer was entitled to courtesy as well as fair value in goods bought. Results: an ever increasing business in a highly competitive field, and contented customers. Here is a lesson for the light and power monopolistic business.

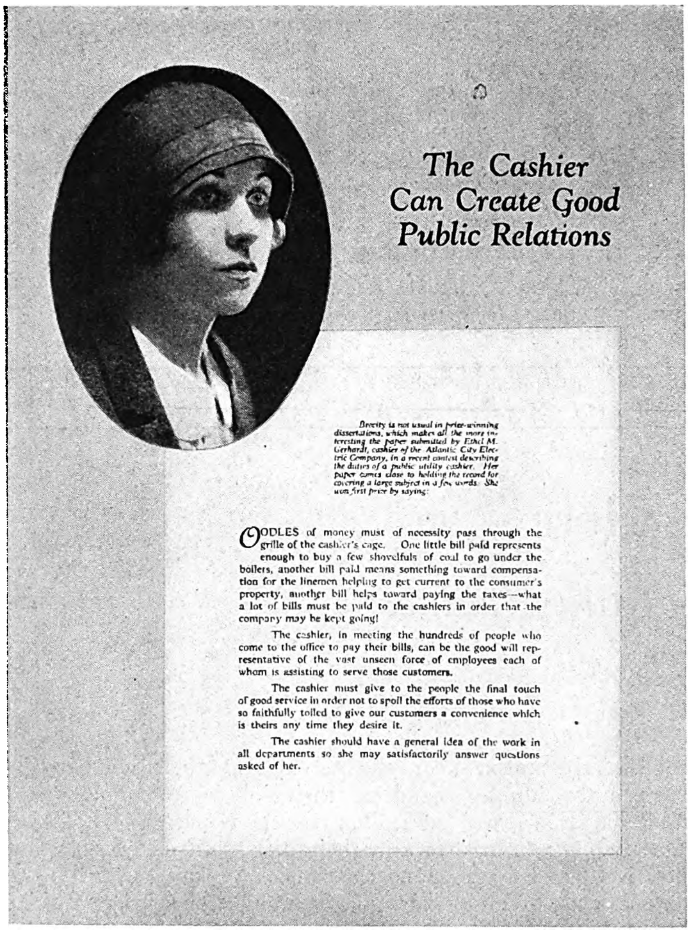
The greatest obstacle to better relations with our customers is, perhaps, the necessity for charging them for electricity. Since this commodity is unseen and mysterious to the lay person, the correctness of its measurement and billing is naturally subject to doubt. Patrons have access to an unlimited supply and literally help themselves to the amount used, never knowing until weeks later how much has been used or what the cost will be. It is only natural that many pay their bills reluctantly.

The paying of bills, even the admittedly just ones, is of itself hardly a procedure that engenders happiness or friendly attitude. This is human nature. It follows, therefore, that of all employees of public utility companies, the cashiers have one of the most difficult contact problems. By the same token theirs is the greatest opportunity to promote good-will and make friends for themselves and their company by handling their job in a manner which will please the many patrons whom they face in their daily routine. Suggestions along this line may prove helpful.

It goes without saying that cashiers should possess pleasing personalities and be courteous, sympathetic and patient. Each customer, regardless of age, sex, nationality, or color deserves to be greeted with a genuine smile. A genuine smile is not a grin or a facial contortion that is obviously a forced effort to look pleasant when you feel otherwise. Many persons could profitably spend considerable time before a mirror learning to smile, and indeed such practice will work wonders. As to courtesy, it is not enough to refrain from being discourteous; lack of courtesy, even while carefully avoiding discourtesy, is a great hindrance to creation of good-will.

Call people by their names. Most people feel flattered to be addressed by name, and this is a sure method of creating a good impression. If we were to analyze the reason why we trade at certain neighborhood stores we would find that it is more often than not because they know us and greet us by name. All contact employees cannot know the names of those with whom they deal, but the cashier has the customer's card (the bill) handed him or her immediately, and it can be used to splendid advantage. Cultivate the habit





The Cashier Can Create Good Public Relations

Brevity is not usual in prize-winning dissertations, which makes all the more interesting the paper submitted by Ethel M. Gerhardt, cashier of the Atlantic City Electric Company, in a recent contest describing the duties of a public utility cashier. Her paper comes close to holding the record for covering a large subject in a few words. She won first prize by saying:

OODLES of money must of necessity pass through the grille of the cashier's cage. One little bill paid represents enough to buy a few shovelfuls of coal to go under the boilers, another bill paid means something toward compensation for the linemen helping to get current to the consumer's property, another bill helps toward paying the taxes—what a lot of bills must be paid to the cashiers in order that the company may be kept going!

The cashier, in meeting the hundreds of people who come to the office to pay their bills, can be the good will representative of the vast unseen force of employees each of whom is assisting to serve those customers.

The cashier must give to the people the final touch of good service in order not to spoil the efforts of those who have so faithfully toiled to give our customers a convenience which is theirs any time they desire it.

The cashier should have a general idea of the work in all departments so she may satisfactorily answer questions asked of her.

Near the cashier's window in the commercial offices of the various operating companies of the American Gas & Electric Company appears this poster carrying a prize-winning essay by Miss Ethel M. Gerhardt. This poster does its bit to assist in creating good public relations.

of calling customers by name when occasion permits.

Common courtesy demands that each and every person be thanked upon completion of a transaction. Most cashiers will stoutly contend that this idea is not new, that they have always done it. To study this question we have lingered around dozens of cashiers' cages in various parts of the country, and with very few exceptions all cashiers went through the motion of saying "Thank You," but a woefully small number accomplished anything through their efforts. Mumbled, unintelligible words, uttered nine times out of ten while looking at the bill or cash box. It is far better to keep still than to utter the lie that your voice, manner, or expression exposes. Look up, smile, say, and mean *"Thank You."* By so doing you improve your own manner as well as create friends for yourself and your company.

Efficiency in handling stubs and cash in the presence of customers begets confidence in you and your company. A speedy, accurate, calm, collected procedure should be developed by those who receive the customer's money if they are to be considered good cashiers. People do not like to see careless and "sloppy" handling of money, particularly that which was recently theirs.

Cashiers sometimes are targets for abuse from certain types of customers even before they are given opportunity to refer the case to the customers' service or adjustment department. Steps must be taken from time to time to impress upon them that any such remarks, criticisms, or abuses from a disgruntled customer is directed not at them personally, but at the company which they for the moment at least personify. Unfortunately race, color, or social status often is basis for the wrong attitude, although more than usual care should be displayed in handling such contacts. Disregarding such conditions is a mark of ability.

Few people have not at some time had the experience of waiting in a store while clerks were plainly not engaged in things they could not leave. This is very annoying. Then, too, being waited upon by a person whose attention is largely given to a fellow employee or even to another customer is a just cause for annoyance. Every patron deserves the undivided attention of the cashier until the transaction is completed, and where it is absolutely necessary to take temporary leave, such as to answer the phone, a mannerly excuse cannot be omitted without overstepping the bounds of courtesy.

Good taste in dress and personal neatness are too well understood to require further comment.

Most utility cashiers are women, and it should be natural for them to represent the company in a pleasant, courteous manner. People expect more of that sort of thing from women, and any deviation from expected standards seems worse than if committed by a mere man.

Cashiers have important positions in the light and power business. The manner in which they handle their duties has a direct bearing upon the attitude of the public toward the company. Any steps which are taken to impress this fact upon the great army of men and women who receive from the public payment for the service rendered will aid in improving customer relations.

Additional Copies?

INVESTIGATION shows that only a comparatively small number of the men and women of the light and power industry who are interested in the subjects covered by Service Suggestions receive them. To meet the situation, Service Suggestions are reproduced in loose leaf form. Copies may be ordered direct from the office of the chairman. A charge of five cents is made to cover the cost of reproduction.

Any desired number of copies of an issue may be ordered or a standing order can be placed for a specified number of additional copies each month. Standing orders may be placed on an annual basis to save the annoyance of remitting small sums each month.

The subjects covered in recent issues were:

63—Courtesy Letters.
64—Tree Trimming from the Public's Viewpoint.
65—The Telephone as a Service Medium.
66—Handling Requests for Discount Allowances.
67—Informing our Customers about our Business.
68—Training Employees in Customer Relations.
69—Records that Speed Service.
70—Employee and Consumer.
71—Correspondence for Good-Will.
72—Teaching Customers to Read Their Meters.
73—Mechanics of Correspondence.
74—The Bill Jones Idea.

Chicago, Illinois.

Electrical Research Statistics

October, 1929

Issued Monthly by Statistical Research Department of the National Electric Light Association
420 Lexington Ave., New York, N. Y.

H. A. Snow, *Chairman, Statistics Committee, Accounting National Section*
Wm. M. Carpenter, *Economist*
H. S. Bennion, *Director of Engineering, N. E. L. A.*
Merle Rainey, *Statistician*

The National Electric Light Association, a voluntary organization of companies and individuals affiliated with or interested in the electric light and power industry, organized to advance the art and science of the production, distribution, and use of electrical energy for public service.

The Association maintains a Statistical Research organization which collects, interprets, and makes available basic statistical information on the electric light and power industry. The publications and services of this department are available to all those interested, on request.

Current Statistics of the Electric Light and Power Industry

(As of July 31, 1929)

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 86 per cent of the industry.

	JUNE		Per Cent Increase	JULY		Per Cent Increase
DURING MONTHS OF JUNE AND JULY	1929	1928		1929	1928	
*Kw-hr. generated (net)	7,295,127,000	6,538,610,000	+11.6	7,534,129,000	6,664,443,000	+13.1
Add—energy imported from Canada and purchased from outside the Electric Light & Power Industry	174,276,000	203,264,000	−14.3	178,710,000	195,000,000	− 8.4
Less—energy used in electric and other departments	184,000,000	200,000,000	− 8.0	191,000,000	192,000,000	− 0.5
Total energy for distribution (kw-hr.)	7,285,403,000	6,541,874,000	+11.4	7,521,839,000	6,667,443,000	+12.8

**As reported by 197 companies in June and 180 in July, included in figures below.

Basic Information on the Electric Light and Power Industry

As of July 31, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the Bulletin.

1. Value of plant and equipment (estimated)	$10,350,000,000*
2. Total generating capacity in kw.	28,588,000
Steam	20,707,000
Waterpower	7,570,000
Internal combustion	311,000
3. Total number of customers served	23,683,000
Farm customers (as reported by 180 companies only)**	(233,000)
Domestic customers	19,485,000
Commercial customers—	
Small light and power	3,620,000
Large light and power	545,000
Others	33,000
4. Population in electrically lighted homes	82,200,000
5. Percentage of homes which are served with electricity	67
6. Miles of transmission lines (11,000 volts and above) (circuit miles)	157,000*

*Subject to revision. **Included below.

Operations of the Electric Light and Power Industry During July, 1929

A FURTHER continuation of the high level of industry and trade is shown by the statistical summary of the distribution of electricity during the month of July. Since the first of the year the total sales of large industrial power were 25,924,000,000 kw-hr., an increase of 3,263,000,000 kw-hr., or 14.4 per cent over the corresponding period last year. Although an increasing irregularity in the activity of production may, perhaps, be noted when these figures are analyzed by the various regions of the country, a sustaining factor is to be found in the remarkable increase in the requirements of irrigation pumping. This is the direct result of the severe and long continued drought, which has reduced the proportion of hydro-electric generation to 38 per cent of total production, as compared with a high point of 43 per cent in May and 43 per cent in July of 1928.

Output Growing Faster than Revenues

While the growth of business—as measured by kilowatt-hours, the most picturesque but not, perhaps, the most important index—has shown a most satisfactory trend, there are, however, others to which attention should be directed at this time.

During the past year the growth in the *number* of new consumers has shown a striking change. As given in the table below, the number of new domestic users has increased, since January 1, by 413,000, or somewhat less than 60,000 per month. At this rate the total for the year will probably be in the neighborhood of 800,000, a decline of 32½ per cent from the 1,185,000 added during the year 1928.

This somewhat sensational loss of nearly 400,000 prospective domestic users over that shown the year before appears to be due, in large measure, to the decline in residential building, whose index stands at approximately the same percentage below 1928. Back of this, again, stand the facts that the post-war housing shortage has been made up, that tight money has further discouraged speculative residential construction and —most important of all—that there has been a progressive decline in the population growth of the country.

This latter fact is of considerable importance to the electric light and power industry, as it has all the indications of permanence and again emphasizes the fact that future expansion must result from a greater use *per customer* and not, as has largely prevailed in the past, from the mere acquisition of *more* customers. That this shrinkage in population growth (with its ultimate limitation of prospective consumer demand) is very real, has recently been illustrated by Dr. Dublin's conservative study, in which the falling birth rate and the stoppage of emigration have been shown as playing important parts.

Coincidently with this diminution in the acquisition of new domestic consumers, the average revenue received per kilowatt-hour sold has shown an accelerated decline. From an average of 6.55 cents in 1928, it has dropped to 6.36 cents for the twelve months ending with July 31. On the basis of the first seven months, the indicated average for the complete year 1929 is thus 6.20 cents per kw-hr.—a decrease of 4.6 per cent below 1928 and comparing with a decrease of 3.7 per cent in 1928 over 1927 and of 2.7 per cent in 1927 over 1926. The net result seems to indicate that, while the kilowatt-hours taken by the average domestic consumer in 1929 will have increased by perhaps 8 per cent, this same consumer's annual bill will only have increased by 2½ per cent. While it points out the continuation of the industry's general policy of more service at lower rates and of its sharing with the consuming public the benefits accruing from improved engineering and management, it emphasizes the widening gap between the gains in kilowatt-hours and the gains in gross revenues.

Electric Light and Power Industry

Growth in Number of Consumers and in Installed Generating Capacity Since the First of the Year, 1929

The data here presented are for the total (100 per cent) electric light and power industry and are based upon the monthly reports received through the cooperation of some 400 companies, representing over 86 per cent of the industry.

Number of Customers

		——Commercial——			
	Domestic Service	Small Lt. & Pwr.	Large Lt. & Pwr.	All Others	Total Customers
December 31, 1928	19,072,000	3,575,000	527,000	29,000	23,204,000
January 31, 1929	19,115,000	3,580,000	532,000	29,000	23,256,000

ENGINEERING SECTION

Alex. D. Bailey, *Chairman* **H. S. Bennion**, *Director of Engineering, N. E. L. A.*

Report of Special Engineering Research Committee

C. F. Hirshfeld, *Chairman*

In the fall of the year 1928, the Special Engineering Research Committee was added to the list of committees of the Engineering National Section of the N. E. L. A. "for the purpose of studying in the broadest possible way the general situation in the power industry in respect to engineering research."

In the past few years it had become very evident that the volume of research work carried on by the member companies and by various national bodies, technical societies and other organizations would soon become so great and so diversified that the existing N. E. L. A. machinery would prove incapable of deriving from it the maximum of usefulness for the member companies. Very good work was being done by the various committees with respect to research in their own particular lines of activity, but the realization had become general that there existed a considerable duplication of effort which was wasteful of time and money, although entirely unavoidable under the circumstances.

In order to study the situation, to provide a clearing house for information on research and an adequate means of instituting new projects, the Special Engineering Research Committee was formed with its purpose and scope of activity defined as quoted above. The first step of the new committee was to gather together a mass of information concerning the research work of the member companies of the N. E. L. A., that of the Association itself and that of other bodies which appeared to be of interest to N. E. L. A. companies. These data, although very incomplete as yet, have already shown that the fears of the Association officials were not groundless. Considerable duplication of effort is indicated by the reports of member companies and committee chairmen. Just to what extent this duplication exists, is impossible to say at present, as the committee has as yet been unable to get sufficient detailed information in most cases.

Take, for example, the investigations of characteristics and performance of lead covered cable. According to the material at hand at present there are seven separate and distinct investigations of such a nature under way, representing the efforts of nine member companies, two national organizationts and five technical schools. No doubt some of these investigations are being conducted along very dissimilar lines with entirely different objectives. This, in fact, is indicated by the individual reports of some of the companies. On the other hand, there is the possibility of considerable undesirable duplication in the case of certain fundamental investigations which fall within the general scope of cable research.

It is also logical to assume that the results of a certain amount of this fundamental research might be very valuable in investigations of a quite different nature. The knowledge of insulating and heat resisting qualities of various materials is certainly not confined in application to cable research alone, but is equally valuable in the solution of. many other problems in power generation and transmission.

The information on hand has been coordinated and arranged in sections according to the nature of the organization doing the work and is included in the supplement to this report. The information at hand is too meagre to justify any claims for completeness or great accuracy in these listings; they are however informative. It is interesting to note that the member companies are doing a large amount of very important work covering a quite extensive field. In most cases the projects have been brought to completion or are under way at the present time, while some jobs are contemplated for the near future.

More detailed information on the individual projects is available in the files of the committees, but it is not considered necessary or advisable to include it in this report.

Prospectus of Electrical Apparatus Committee Activities for 1929-1930

R. A. Hentz, *Chairman*

The Electrical Apparatus Committee for the past three years has functioned with four major subcommittees, viz., the Generating Stations, Substations, Operating Practice and Utilization Subcommittees, and for a part of that time with a fifth, known as the Fundamental Plans of Systems Subcommittee. This subcommittee, because of the broad scope and importance of the field it covered, has since taken the status of a separate committee of the Engineering National Section known as the Power Systems Engineering Committee.

As a result of the experience obtained with these subcommittees, it appeared to be a logical and desirable step to abandon the Generating Stations and Substations Subcommittees, which necessarily have a number of common problems, and to replace them with three subcommittees whose duties will involve less overlapping of subjects. The three new subcommittees are the following:

Station Design Subcommittee.
Machinery Subcommittee.
Protective Equipment Subcommittee.

The Station Design Subcommittee will consider problems relating to the physical and electrical design of both generating stations and substations; the Machinery Subcommittee will deal with generators, electrical transformation apparatus, both rotating and static, and their associated equipment including switchboards, conductors, insulators, etc., and the Protective Equipment Subcommittee will study problems on relays and relay protective systems, circuit breakers of all types, reactors, resistors, lightning arresters, choke coils, etc.

In addition to these three subcommittees, the Utilization, Operating Practice, Foreign Practice, and the Codes Subcommittee will be continued. The Publications Subcommittee will be discontinued, its functions being absorbed elsewhere.

It is probable that four meetings of the committee will be held during the year, the first taking place in Pittsburgh on Oct. 2 and 3 in conjunction with the first group meeting of the Engineering National Section, and the third in connection with the second group meeting of the National Section. The locations and dates for the other two meetings have not yet been definitely determined.

The committee has a large list of subjects for consideration during the coming year, among the most important of which are the following:

1. Revision of the Relay Handbook.
2. Further studies on neutral grounding.
3. Further standardization of utilization voltages.
4. Motor installation rules.
5. Formulation of motor starting rules consistent with modern practice.
6. Cooperation with the Edison Association in standardization of oil circuit breakers.
7. Standardization of phase angles, positions, and sequences.
8. Lightning arrester test standards.
9. Standardization of terminal lugs.
10. Research on insulating oils.
11. Further standardization of insulating oils.
12. Experience with mercury arc rectifiers.
13. Suggest specifications for rubber insulations.
14. Standardization of lead arrangement for induction regulators.
15. Hydrogen filled rotating apparatus.
16. Apparatus fires and fire protection.
17. Frequency converters.
18. Standardization of markings for multi-conductor control cables.

It is expected that two serial reports will be issued during the year, one on "The Function of the Generating Station in System Control" and the other a revision of serial report No. 24-34, "Electrically Driven Auxiliaries in Steam Generating Stations." Should consideration of the subjects listed above develop the necessity for serial reports, they will be undertaken.

In addition to the publication of serial reports, short articles on specific subjects of immediate interest, as well as general articles summarizing committee discussions at the meetings, will appear in the N. E. L. A. Bulletin.

Joint Subcommittee on Development and Research Releases Four Reports to Member Companies

THE Tenth Semi-annual Meeting of the Joint Subcommittee on Development and Research of the N. E. L. A. and Bell System was held at New York on May 29, 1929. The subcommittee reviewed the work that had been carried on by its eleven project committees during the six months' period since its preceding meeting. The project committees presented reports which showed that considerable progress had been made during this interval.

Of these reports, four were considered to be of sufficient general interest to warrant further distribution. These were transmitted by the Development and Research Subcommittee to the Engineering Subcommittee with the recommendation that they be made available to member companies of the N. E. L. A. and associated companies of the Bell System. The Engineering Subcommittee, acting upon this recommendation, released the reports and instructed the Headquarters Staffs to make them available as recommended. The ground covered by these reports is briefly indicated below.

Protection of Telephone Circuits

Project Committee No. 2, which deals with the protection of telephone circuits, presented a report on tests made at Athenia, N. J. This investigation was undertaken for the purpose of ascertaining the causes of the operation of protectors on an aerial telephone cable which parallels an underground power cable. It was known that disturbances in the telephone circuits were experienced at a time when fault conditions obtained in the power system. A significant conclusion to be drawn from this study is that the phenomena which were at first attributed to a rise in ground potential were found actually to be due to induction. Information is given in the report on the distribution of ground potential around the Athenia Substation, the coefficients of induction between the power and telephone circuits, and the division of return fault current between the power cable sheaths and ground.

Power Circuit Residuals

The report from Project Committee No. 3, on power circuit residuals and methods for their control, covered its investigation of residuals under fault conditions in the 33-kv. network in Dayton, Ohio. Information is given on the distribution of currents and voltages in the interconnected network, together with the effects on currents and voltages at time of fault due to the placing of various amounts of resistance in the grounding connection of the system. Methods of calculation are explained for obtaining the fault current, the distortion of the voltage triangle, and the power available for the operation of directional ground relays for a phase-to-ground fault. These include an expansion of the zero-phase sequence method of calculating short-circuit currents in order to include the effects of load and of line capacitance to ground.

Joint Use

Project Committee No. 6, which is concerned with Joint Use, presented the complete report on its Minneapolis investigation. This supersedes the Progress Report which was prepared and distributed in 1926 in order that the outstanding results of this investigation would be available without awaiting the time necessary for the preparation of the complete report. The report treats in considerable detail the inductive relations between power distribution circuits and telephone subscriber circuits. The data presented make it possible to obtain the changes in influence resulting from modifications in the type of distribution circuit, and also the changes in susceptiveness resulting from modifications in the telephone circuit. The coupling between these classes of circuits and the shielding by the telephone cable sheath is fully treated.

Inductive Susceptiveness of Automatic Train-Control System

Project Committee No. 6 also presented a report giving the results of its study of the inductive susceptiveness of an automatic train-control system. This work, although outside of the scope of the project committee, was carried out in order to establish the limiting conditions for tests on the experimental line in Elmira so that there would be no danger of causing false operation of the train-control system on the paralleling railroad.

These reports are now being printed, and they will be available to interested parties about the middle of November.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912

Of N. E. L. A. Bulletin, published monthly, at New York, N. Y., for October 1, 1929.

State of New York.
County of New York.

Before me, a Notary Public in and for the State and county aforesaid, personally appeared Wilgar Coleman, who, having been duly sworn according to law, deposes and says that he is the Editor of the N. E. L. A. Bulletin, and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 411, Postal Laws and Regulations printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are: Publisher, National Electric Light Association, 420 Lexington Avenue, New York City; Editor, Wilgar Coleman, 420 Lexington Avenue, New York City; Managing Editor, none; Business Manager, none.

2. That the owners are: National Electric Light Association, 420 Lexington Avenue, New York City, Mutual Organization, not incorporated. Membership approximately 22,000. M. S. Sloan, President, New York N. Y.; P. S. Young, Treasurer, Newark, N. J.: Paul S. Clapp, Managing Director, National Electric Light Association, 420 Lexington Avenue, New York City.

3. That the known bondholders, mortgagees and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages or other securities are: None.

Wilgar Coleman,
Editor.

Sworn to and subscribed before me this 24th day of September, 1929.

(Seal) Jessie S. Riker,
Notary Public, N. Y. County.
(My commission expires March 30, 1931.)

PUBLIC RELATIONS SECTION

Harry Reid, *Chairman* **George F. Oxley**, *Director, Department of Public Information*

Public Relations Section Executive Committee Meeting

PLANS for a National Employees' Speaking Contest, arranged by the Public Speaking Committee, W. S. Vivian, chairman, have met with enthusiastic acceptance throughout the industry, according to reports presented by representatives of all Geographic Divisions attending the meeting of the Public Relations National Section Executive Committee in Chicago, Sept. 24.

Chairman Vivian also reported, stating that his committee had met the previous day with a complete representation from Geographic Divisions. Each division reports work well in hand with committees appointed to conduct the contest and arrange for the individual company contests and state contests for elimination purposes prior to the holding of the Geographic Divisions contests. The final date for the holding of divisional contests has not been set, but will be announced in the near future. All of these contests, of course, must be completed sufficiently in advance of the 53rd Convention of the Association, to be held in San Francisco the week of June 16, to permit of arrangements being made for the holding of the national contest.

Committees Functioning

The Section's Executive Committee meeting was exceptionally well attended and except in one or two instances where conventions were held late in the summer, divisional committee organization has been completed and the committees are functioning on the year's program.

The meeting was presided over by Chairman Harry Reid, who first called upon divisional representatives and Geographic Division presidents for statements regarding activities in their divisions. He then asked Managing Director Paul S. Clapp for a statement of headquarters activities, and subsequently received oral reports from the chairmen of the several committees of the section.

W. H. Hodge, chairman of the Customer Ownership Committee, reported his committee had held a meeting the previous day, with good attendance. He said the committee is making a complete study of the subject of customer ownership. Greater cooperation with the Better Business Bureau was urged as was also the formation of thrift savings clubs among employees.

Industrial Relations

Homer E. Neisz, chairman of the Industrial Relations Committee, called attention to the committee's four serial reports on Contact Training, also to a report by the Medical and Health Subcommittee. Mr. Neisz stated his committee feels that its work this year should center largely on the introduction and perusal of this text material, and it is the purpose of the committee to disseminate the material through the Geographic Divisions. In order to acquaint the Geographic Divisions with the program arranged, a meeting of the committee was scheduled for September 28 and 29 in Chicago. At this meeting will be presented a discussion of the reports in the form of questions, the answers to all of these questions being contained in the reports themselves; also the committee will prepare a method, or several methods, by which these reports can be best utilized. Following this meeting, division conferences will be arranged at which all member companies will be represented. The subcommittee on Medical and Health is preparing a further report, which, it is hoped, will be of such a nature that it can be used as text material for distribution to Geographic Divisions during the following year. A new subcommittee has been formed on Methods of Arranging and Holding Employee Educational Meetings. The subcommittee is actively at work and will prepare and issue a report during the year.

John F. Gilchrist, chairman of the Relations with Educational Institutions Committee, stated that one of the great problems the electric light and power industry has, in common with other great industries in this country, is the question of securing properly trained young men and women, and that he hoped his committee will be able to map out a policy that will accomplish much in this direction.

Women's Committee

Miss Sara Harris, chairman of the Women's Committee, reported that her committee had held a well-attended meeting the previous day. Three subcommittees had been appointed: Home Service, Manufacturers and Safety. She stated that the Home Service Committee has definite plans for promoting home service work within the electrical industry. A manual of "How to Organize and Operate a Home Service Department" will be issued shortly. Also, a service is being inaugurated at headquarters which will give to Home Service Departments, and companies interested in establishing Home Service, information and material of assistance to them. The Manufacturers Women's Subcommittee program for the year will aid in carrying out home service and educational programs of the Women's Committee. The Safety Subcommittee will work with the Accident Prevention Committee and the Home Safety Committee of the National Safety Council. The educational program of the Women's Committee, which will be printed and distributed during October, will embrace the general topics of Economics of Utility Industry, Electricity in the Home, Safety, and Proper Manner of Employee Contact with Customers. Miss Harris stated that women's committees all over the country are cooperating in the National Food Preservation Program and Light's Golden Jubilee, and will take an active part in the National Employees' Speaking Contest.

Miss Eloise Davidson was called upon by Chairman Reid. She urged that more attention be paid to building the "household load."

Chairman Reid announced that Charles B. Stuart of Halsey Stuart & Company, New York, has accepted the chairmanship of the Relations with Financial Institutions Committee and that a program of that committee's work will be available shortly.

Report of Director of Public Information

In the absence of T. A. Kenney, chairman of the Information Bureau Committee, George F. Oxley, director, Department of Public Information, N. E. L. A., reported that a meeting of directors of information bureaus and publicity men of the larger companies is planned for November 11 and 12 in Chicago, and it is the hope of the committee that every director will be present and as many as possible of the public relations men.

Mr. Oxley, reporting on the activities of the Department of Public Information, called attention to three weekly services sent out from headquarters, the Information Letter, Public Opinion, and Electrical News Items, and to the monthly Advertising Copy Service, also to Electrical Research Statis-

Fifth Annual Commercial School in Nebraska

By THORNE BROWNE

NEBRASKA Section National Electric Light Association, closed its fifth annual school for commercial men Sept. 14 with a registration of 116. It was the most successful school so far held.

The program was so arranged that time was fairly well divided between talks from outstanding nationally known sales experts and round table discussions of the salesmen themselves relating to everyday problems. Every company operating in the state sent considerable delegations. Jobber and manufacturer representatives of this territory also attended.

Outstanding numbers on the program were as follows:

"What is Selling?"
P. L. Miles, Edison Electric Appliance Co., Chicago, Ill.
Discussion by H. G. Kobick, Hurley Machine Co., Chicago.
"Training Salesmen, and Salesmen's Responsibilities."
R. B. Wilson, President, The Premier Co., Cleveland, Ohio.
"Selling Small Appliances."
C. Lammers, General Electric Co., Chicago.
"Rural Merchandising."
K. R. MacKinnon, Nebraska Power Co., Omaha, Neb.
"Selling Better Lighting."
W. H. Rademacher, Edison Lamp Works, Chicago.
"Selling Electric Cookery."
W. A. DannenHauer, Edison Electric Appliance Co., Chicago.
"Publicity."
Marshall Adams, Westinghouse Company, Chicago.
"Public Relations in Selling."
Colonel G. W. Hill, Automatic Washer Co., Newton, Iowa.
"What Electric Refrigeration Will Do."
J. S. Sayre, Kelvinator Corporation, Detroit, Mich.

All these numbers were discussed by sales managers and salesmen following the leading discussion.

This annual instruction school is a camp affair. Sessions are held at a Y. M. C. A. camp remotely located on the banks of the Blue River. Each registrant pays a definite fee upon arrival for which he is entitled to quarters and excellent food. Permanent bunk houses supply sleeping quarters.

The school is run with a good deal of precision. Committees have charge of each portion of the activities and are responsible for their part being done. Every registrant is supposed to attend the sessions. A police committee has the job of seeing that the attendance is complete. Their duties are light, for the sessions are so interesting that approximately 100 per cent attendance is present at each session. School hours are so arranged, however, that some time is offered for recreation and provision is made through committees for opportunity to play.

Stanley Taber, general sales manager, Iowa-Nebraska Light & Power Company, was general chairman of this year's school.

In return for use of the camp the commercial men have undertaken to improve facilities and accommodations, and as a result of several years of effort there is now installed complete sanitary equipment, water pressure system with electric pump, a completely electrified kitchen, and electric water heaters for dish washing and shower baths.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

Pennsylvania Electric Association Convention

MORE than 900 delegates and guests registered for the twenty-second annual convention of the Pennsylvania Electric Association, held at Bedford Springs, Pa., on September 4, 5 and 6. Notable among those urging increased commercial activities as the most promising and pressing of current opportunities for utility organizations were Mathew S. Sloan, president of the National Electric Light Association; Frank R. Phillips, president of the Pennsylvania Electric Association and senior vice-president of the Philadelphia Company; A. B. Millar, managing director of the Pennsylvania Electric Association, and E. W. Judy, vice-president and general manager of the Duquesne Light Company.

"We have accomplished great things technically," said Mr. Sloan. "We have done great things in making ever-improving service available to more and more people for more and more forms of use. But we still have a long way to go, both in reaching others who could profit by the use of electric service and in effecting a wider use of service by those now on our companies' lines. The test of our industry now, as in the past, is its usefulness to the public. The path of progress for us is clearly outlined. It is to supply better service, to reach more customers with it, to sell it at lower rates and to make it more useful to all our customers."

A reception to President and Mrs. Phillips on Wednesday evening was the only official activity that day. The first general session on Thursday was given over to the presidential address, the reports of various committees and an address by A. B. Millar, managing director of the association. President Phillips particularly emphasized the rapid growth of rural electrification in Pennsylvania, showing that while between 5 and 6 per cent of the nation's farmers received the benefits of electric service, in Pennsylvania 32.5 per cent were served. Present construction work is proceeding in that state at a rate of 4.7 miles per day, an estimated daily gain of 54 rural customers.

Following a review of the year's work, C. H. Frick, Pennsylvania Power & Light Company, chairman, at the engineering session Thursday afternoon, introduced E. C. Stone of the Duquesne Light Company, who emphasized the benefits to be derived from the committee work of electrical associations and who contended that engineering policies should be formulated with public and commission viewpoints in mind in order to promote harmonious relationships.

C. S. Coler of the Westinghouse Electric & Manufacturing Company discussed the recruiting and training of engineers for the power industry, pointing out that the supply of well-qualified men has always been limited and that the full co-operation of manufacturers and utilities is to be encouraged.

In enumerating the various activities to which safety department work is related, Edward C. Spring, director National Safety Council, gave relative preference to operating, construction, employment, purchase of supplies, welfare of employees and public relations. "Every employee should be in complete accord with what safety means to him and his fellow workers or be removed," said Mr. Spring.

A demonstration of the transformation of light energy to sound energy and of the transmission of sound by projected light paths was made by John B. Taylor of the research laboratory of the General Electric Company.

As chairman of the accounting session H. P. Smith of the Duquesne Light Company suggested that the accountant was becoming more and more important in utility work, if for no other reason because of his relation in establishing fundamental facts for action in the increasingly important transition between existing and proposed rate forms. E. A. Davis, general auditor Middle West Utilities Company, paid high tribute to the results for improved economy realized through the uniform classification of accounts.

"What About Public Relations?" was the title of the address by Harry Reid, president of the National Electric Power Company and chairman of the Public Relations National Section of the N.E.L.A. "It has always been my belief," Mr. Reid said, "that good service is the best answer to the demagogue. Here are the two goals of public relations work—to understand and to be understood, to know and to be known, and to be guided and helped by this mutual process."

Henry Swift Ives of the Association of Casualty and Surety Executives spoke on "The Duty of Industry to the Public," and R. N. Blasingame, chairman of the farm machinery division at Pennsylvania State College, reviewed progress in the use of electricity on the farm and its potentialities.

The final session, that of the Commercial Section, was addressed by H. C. Thuerk of the Erie Lighting Company, chairman; A. W. Robertson, chairman of the board of the Westinghouse Electric & Manufacturing Company; Paul Freedley of the Pennsylvania Salt Manufacturing Company, and A. S. Turner of the Edison Lamp Works. Mr. Robertson reminded the audience that the point of view of the customer is non-technical. Mr. Freedley emphasized the influence of obsolescence of generating equipment in private plants and central stations upon the decision of the industrial customers to purchase power, and urged the continued and more intensive study of "border-line" conditions to determine the economics of any given problem. According to Mr. Turner, America pays $45,000,000 a year for light that it never receives, owing to drops in voltage on the customers' premises occasioned by inadequate equipment.

The program included a number of special entertainment features, a session for women, talking "movies" at each session presenting prominent men and their messages, and a first-aid contest.

Officers for the coming year are: President, John F. Ford, Philadelphia Electric Company; vice-presidents, F. B. Hofft of Johnstown and W. H. Horton, Jr., of Pittsburgh.

New England Division Convention

THE twenty-first annual convention of the New England Division of the National Electric Light Association, held Sept. 9-12, at New London, Conn., was most successful from every standpoint.

After Lieutenant-Governor Rogers of Connecticut had welcomed the visitors, President M. S. Sloan of the national body spoke at the opening session upon the economic contributions and opportunities of the industry to the public welfare, stressing the effect of electric service upon mass production, high wages and purchasing power, pointing out the importance of promotional rates and alluding to the need of long-time programs for complete home electrification instead of flash-in-the-pan campaigns.

Charles A. Eaton, member of Congress from New Jersey, voiced the ideals of the industry's service which have strengthened its position as a major factor in the growth of civilization and urged stalwart defense of proven policies in the face of political attacks. Richard T. Higgins, chairman of the Connecticut Public Utilities Commission; John L. Madden, vice-president of the Metropolitan Life Insurance Company; Managing Director Paul S. Clapp, Anna Steese Richardson, Dudley Harmon, executive vice-president New England Council, and Katherine A. Fisher also contributed timely addresses.

President I. W. Day's address stressed the need of a greater effort to increase the per capita use of electric service in New England, which has 10 per cent of the central-station customers of the country with only 6.5 per cent of the electricity generated. He also advocated a simplification of the committee work of the association.

Chief interest perhaps centered in the Commercial Section. In opening its sessions on Tuesday, President Day admitted that inducement rates, appliance sales, window-dressing and other things are essential factors in increasing the sale of electric service, but held them to be useless unless backed up with real sales effort.

D. M. De Bard, chairman of the Merchandising Bureau, dwelt chiefly on the great opportunities left for merchandising, pointing out that 33 per cent can be added to domestic lighting, 70 per cent to home appliances, and about 98 per cent to ranges and water heaters. On conservative estimates the average domestic revenue can be raised to $100 a year. He declared, however, that inducement rates are a prerequisite to increased sales.

Miss Sarah Harding Hunter cited several conditions that are preventing wider acceptance of household conveniences, mentioning the pride with which some thrifty housewives hold down the use of energy. Furthermore, she took utility people to task for not practising what they preach, quoting from the testimony of 150 executives and the same number of employees to show their own limited use of appliances.

W. G. Keay sketched efforts being made to arouse a greater appreciation of the importance of low temperature in preserving food and health.

The principal speaker before the Power Bureau group—John L. Madden—reviewed the findings of the Metropolitan Life Insurance Company on "migration of industry," originally presented at Atlantic City, and went into some details affecting New England. The most significant conclusions which he drew from the national figures are: (1) that the net value of attempting to attract industries into new territories is very small and hardly justified by the expense; (2) little money is spent to help new industries develop once they are obtained; (3) adequate data are not kept on the rate of expansion of existing industries, and (4) little attempt is made to ascertain why industries move away. To serve as a barometer of business, Mr. Madden said, the survey should be made perpetual by some neutral organization like the United States Department of Commerce.

The principal points made by A. W. Milliken, chairman of the Power Bureau, were that utilities should be guided in their sales work by what is best in the long run for their customers and that an opportunity to formulate rates should be given to power salesmen.

The Accounting Section held two large and enthusiastic sessions on Monday, at which much informal discussion took place on merchandising accounting and other moot topics. A women's session on Wednesday morning, one of public relations on the evening of the same day and an engineering session on Thursday morning all proved worth while.

Empire State Convention

REFUTATION of some of the statements recently made by Governor Franklin D. Roosevelt of New York regarding the alleged neglect of the farmers of that State by the electric utilities was included in the address of President C. S. Ruffner at the annual convention of the Empire State Gas and Electric Association, held at Upper Saranac, N.Y., on September 19 and 20. "This branch of our business," said Mr. Ruffner, "which holds such tremendous possibilities in load building, has shown very substantial progress in the last three years. New York State now ranks second only to California in the number of farms served with electricity."

In order to meet the problems involved in further extending service, Mr. Ruffner pointed out the necessity of developing more aggressive sales efforts and of reconstructing and modernizing rate structures. "In this matter of rates," contended the president, "the public has certain rights. It is entitled to rates that it can understand. This means the simplification of rate structures and the elimination of that vast growth of schedules that has evolved either out of constantly changing conditions in the industry or out of an attempt to patch up some purely local situation with a new rate."

Matthew S. Sloan, president of the National Electric Light Association, also addressed the convention on Thursday. Mr. Sloan said: "There lies before us another opportunity for service. As we have been a basic element in revolutionizing conditions in American industry, so we must take equal part in revolutionizing American homes. We of the power and light companies have neither taken full advantage of our opportunities as business men nor done our full duty as agencies of public service."

Other speakers on the first day's program were Dean W. E. Mosher of the School of Citizenship and Public Affairs, Syracuse University; Earl Whitehorne, assistant vice-president McGraw-Hill Publishing Company, and Albert W. Whitney, president National Bureau of Casualty and Surety Underwriters. Dean Mosher viewed the electric utilities as needing a more positive and constructive leadership. As a first step he advocated the establishment of an industry code of ethics for both operating and holding companies. Mr. Whitehorne foresaw the need in the utility business of a closer approach to the attitude of other businesses which advertise and sell, not their factories or gifts to humanity, but their products in terms of the user's interest. Mr. Whitney, whose topic was "Accident Prevention from an Executive Point of View," compared the old ideas of safety to an appliqué affixed after the engineers and architects had done their jobs, while the newer attitude makes safety a production factor.

In discussing the water-power development of New York State at the Friday session, R. J. Le Boeuf, Jr. cited decisions of the courts in past years and analyzed present political and legal elements, concluding that in New York there is little likelihood of State water-power development and that private enterprise should push ahead. Navigation he regarded as a secondary issue, from the standpoint of public welfare, power development being the important thing.

Other speakers on Friday included Senator Seabury C. Mastick, who advocated a State department of commerce; Oscar H. Fogg, president American Gas Association, and Frieda Miller, director Bureau of Women in Industry, who urged better appreciation of the woman's viewpoint as a consumer of manufactured products and as a worker in industry.

Reports of the year's activities were made by the chairmen of the accident prevention, accounting, electric meter, public utility information, public speaking, women's, electric, commercial and gas sections.

Officers elected for the coming year are: President, William J. Welsh, president New York & Richmond Gas Company; first vice-president, John N. Carlisle, president Northern New York Utilities, Watertown; second vice-president, F. W. Smith, vice-president United Electric Light & Power Company, New York; treasurer, H. O. Palmer, vice-president Empire Gas & Electric Company, Geneva.

Rocky Mountain Division and Two State Associations Hold Joint Conventions

SPORT, entertainment and business divided the attention of the delegations to the joint convention of the Rocky Mountain Division of the N. E. L. A., the Colorado Utilities Association and the Wyoming Utilities Association held at Glenwood Springs, Colo., on Sept. 2, 3 and 4.

The first day was devoted entirely to pleasure. On Tuesday and Wednesday the delegates got down to business, W. D. Johnston, president of the N. E. L. A. division, and V. L. Board, president Colorado Utilities Association, presiding jointly.

Following Mr. Johnston's official address were speeches by Managing Director P. S. Clapp and other representatives of the national body. The Light's Golden Jubilee theme pervaded all the proceedings. Mr. Clapp reviewed the progress of the industry and declared that it is on the threshold of developments so momentous that even its leaders can hardly grasp their significance.

C. E. Greenwood, commercial director N. E. L. A., described the national food preservation program and its relation to the electrical industry. Talking motion pictures of Edison and other notable men with messages to deliver to utility builders were presented, a review of the Atlantic City N. E. L. A. convention was given, and an informative meeting for women was held in which wives of the delegates took part.

Other addresses were made by Mr. Board, B. J. Mullaney of Chicago, F. S. Peterson of the Public Service Company of Colorado, who spoke on the utilities' interests in airport development; Howard S. Robertson, who spoke on the changing aspects of mass transportation, and R. W. Lindsay, telephone engineer.

A picnic was held on Tuesday evening, and the annual banquet concluded the program Wednesday night. J. A. Clay, Western Colorado Power Company, was elected president of the Rocky Mountain Division, N. E. L. A.; Ray M. Morris, Mountain States Telephone Company, of the Colorado Utilities Association, and H. L. Williams, Evanston, Wyo., of the Wyoming Utilities Association.

WOMEN'S COMMITTEE

Miss Sara Harris, *Chairman* **Miss Isabell Davie**, *Secretary*

News Letter

By Mrs. Thelma Van Ness
Publicity Chairman

PERSONNEL WOMEN'S COMMITTEE—1929-30

Chairman

Miss Sara Harris, Utica Gas & Electric Co., Utica, N. Y.

Vice-Chairman

Mrs. Ruth E. Creveling, San Diego Consolidated Gas and Electric Co., San Diego, Cal.

Secretary

Miss Isabell Davie, N. E. L. A., New York, N. Y.

Members-at-Large

Miss Marguerite Butler, Portland Electric Power Co., Portland, Ore.
Miss Florence Clauss, Electrical Merchandising, McGraw-Hill Pub. Co., New York, N. Y.
Mrs. Pearl Evans, National Electric Power Co., 57 William Street, New York, N. Y.
Miss Florence Freer, Brooklyn Edison Co., Inc., Brooklyn, N. Y.
Miss Sophia Malicki, Middle West Utilities Co., Chicago, Ill.
Miss Elizabeth Murray, Atlantic City Electric Co., Atlantic City, N. J.
Miss Helen Norris, Commonwealth Edison Co., Chicago, Ill.
Miss Helen Smith, Rochester Gas & Electric Corp., Rochester, N. Y.
Mrs. Florence Tate, Central & South West Utilities Co., Dallas, Tex.
Mrs. Thelma Van Ness, Consumers Power Co., Jackson, Mich.
Miss Mary Walsh, The Washington Water Power Co., Spokane, Wash.
Mrs. Sarai Waugh, Westchester Lighting Co., Mt. Vernon, N. Y.
Miss Clara Zillessen, The Philadelphia Electric Co., Philadelphia, Pa.

Division Representatives:

Canadian
Miss Florence Donkin, The Shawinigan Water & Power Co., Montreal, Canada.

Eastern
Miss Iva B. Sellers, Pennsylvania Electric Co., Johnstown, Pa.

East Central
Mrs. Beulah K. Yewell, Kentucky Utilities Co., Louisville, Ky.

Great Lakes
Miss Edna J. Decker, Illinois Northern Utilities Co., Dixon, Ill.

Middle West
Miss Louise Hathaway, Iowa Railway and Light Corp., Cedar Rapids, Iowa.

New England
Miss Sue Carr, Central Maine Power Co., Augusta, Maine.

North Central
Mrs. Mabel Wilson, Northern States Power Co., Minneapolis, Minn.

Northwest
Mrs. Gertrude McDevitt, Idaho Power Co. Boise, Idaho.

Pacific Coast
Mrs. Nyra G. Letchworth, San Joaquin Light & Power Corp., Fresno, Cal.

Rocky Mountain
Miss Irma Ward, Public Service Company of Colorado, Denver, Colo.

Southeastern
Miss Dorothy Murphy, The Tennessee Electric Power Co., Chattanooga, Tenn.

Southwestern
Miss Julie Pailet, New Orleans Public Service, Inc., New Orleans, La.

Subcommittees:

Home Service
Miss Ada Bessie Swann, Public Service Electric & Gas Co., Newark, N. J.
To develop programs of Home Service activities; to assist in establishing Home Service Departments.

Manufacturers
Miss Frances Weedman, Edison Electric Appliance Co., Inc., Chicago, Ill.
To develop cooperation between women of electric serving companies and of manufacturers of electrical household equipment toward accomplishment of the purposes of the Women's Committee.

Safety
Miss Esther Rockey, The Dayton Power & Light Co., Dayton, Ohio.
To develop programs of Safety and First Aid activities for Women's Committees.

* * *

Mrs. Ruth Estelle Creveling, San Diego, Cal., has been appointed vice-chairman of the National Women's Committee, by Miss Sara Harris, chairman of the committee.

Mrs. Creveling is editor of the *News-Meter,* the company magazine of the San Diego Consolidated Gas & Electric Co. She has been active in Women's Committee work in her company for a number of years and for the last two years has served as a member of the National Women's Committee, representing the Pacific Coast Geographic Division.

Mrs. Ruth Creveling

* * *

The appointment of Mrs. Pearl W. Evans as chairman of the Women's Committee, National Electric Power Company, New York, N. Y., has been announced by Harry Reid, president.

Mrs. Evans is well known to many persons in the electrical industry who will be glad to know she is resuming active connection with Women's Committee work. The National Electric Power Company operates in fourteen States, and Mrs. Evans will spend much of her time visiting the various company Women's Committees.

* * *

Miss Dorothy Murphy, chairman of the Southeastern Division, has announced a contest plan for her division for the year 1929-30. Instead of the usual elimination contests that have been featured in the past, the current contest will run throughout the year, and prizes will be awarded on a point basis. Points will be earned by the women employees through participation in any or all of the following activities:

	Points
1. For each essay or published article written on any subject relative to the business (200 words or more)..	10
2. For the best essay in the company committee during any month ..... (not effective unless there are two or more essays written)—company department heads or officials to be the judges	25
3. For each talk made before the company committee on a subject relating directly or indirectly to the business	10
4. For the best talk in a company contest	25
5. For each playlet written relative to any phase of the business.........	25
6. For each participation in any playlet produced (each actor)	10
7. For mastery of the Prone Pressure Method of Resuscitation .... (to be judged by Safety Director or other person qualified)	15
8. For each suggestion made and adopted by the company	25
9. For attendance at meetings—each meeting	5

The contest dates from Aug. 1, 1929 to March 31, 1930. All women employees of companies which are members of the Southeastern Division, N. E. L. A., shall be eligible with the exception of state chairmen and division chairmen. The normal activities of chairmen, secretary and other officers shall not count for points in contest. The following prizes will be awarded at the 1930 Division Convention: $40 to the woman earning the highest number of points in each state; $60 to the woman earning the highest number of points in the entire division; $50 to the company committee having the highest average number of points per member.

Miss Murphy is secretary to J. Conn Guild, vice-president and general manager of the Tennessee Electric Power Company at Chattanooga.

* * *

Several girls in the Illinois Power & Light Corporation are taking active parts in various women's clubs. Miss Viola Stevens, Centralia, Miss Marguerite Miller and Miss Osceola Thornberry, Mt. Vernon, all hold offices in the Business & Professional Women's Clubs in their cities. Miss Lelamae Wood, also of Mt. Vernon, was recently reelected president of the Junior Women's Club. The Misses Thornberry, Wood and Brydon, Mt. Vernon, assisted in the arrangements for the convention of the Illinois Federation of Business and Professional Women held at Mt. Vernon in May.

* * *

Miss Isabell Marquedant, Consumers Power Company, Jackson, Mich., has been appointed Michigan Chairman of the Women's Committee. Miss Charlotte Howard, Jackson, Mich., has been named company chairman for Consumers Power Company. Miss Howard will have fifteen district chairmen, throughout the properties of this company, reporting to her.

* * *

The Consumers Power Company Women's Committee, Owosso, Mich., appeared before the Corunna Women's Club on the occasion of their Community Day Meeting, presenting the "Pageant of Light." There were seventy-five in the audience.

* * *

Nine Central Illinois Public Service Company girls presented the playlet "Evolution of Lighting" before a group of ninety-five, the McDonough County Federation of Women's Clubs, at Macomb, Ill. At Ashland, Ill., a toaster demonstration was given by the Women's Committee in the office of the Central Illinois Public Service Company.

* * *

The August number of *Hi-Voltage,* the magazine of the Empire State Electric Company at Joplin, Mo., was edited by the Women's Committee, under the editorial direction of Misses Nelia Whitford and Cleo Woodworth. This is a sixteen-page publication, filled with interesting news items of interest to company employees. One article tells of a $100 prize won by Miss Helen Tippit in the annual Window Trimming Contest of the Hoover Company, and there is a story about Mrs. W. Lloyd Howard who recently stepped into her husband's shoes and made a wonderful record holding down his job during his illness. Mr. Howard is a securities representative of the Henry L. Doherty and Company Securities Department at Aurora, Mo., and when he was compelled to take a complete rest, Mrs. Howard appeared on the scene and took care of his business splendidly. In fact, she won a fishing trip for Mr. Howard which he had a standing chance to win at the time he became ill.

* * *

In the July issue of *Cipsco News,* Central Illinois Public Service Company, there is an article in the Home Service Department, Miss Gertrude O'Brien, associate editor, about a company school held at Mattoon for a period of three days in July to further acquaint and instruct the women employees with the major appliances sold by the company. The school was planned for range demonstrators, personal service representatives, saleswomen and other women interested in appliances. The chief emphasis of this school was placed on electric cookery and electric refrigeration. Mrs. Margaret H. Craig, Home Economics Consultant of the Middle West Utilities Company, conducted demonstrations on the electric range and special instructions on electric refrigeration were given by Miss Mary Kirk of the Kelvinator Company.

* * *

A member of the Women's Committee of the Portland Electric Power Company, Portland, Ore., Mrs. Grace Parke, last winter won the second prize in that division in the National Lamp Sales Contest. This season she has won all sorts of honors in the National Thor Ironer Contest conducted by the Hurley Machine Company of Chicago. This contest was from June 3 to 29, all sales to be made between those dates. The results were figured each week for four weeks. Miss Grace Parke was in Group 4, competing with men and women selling Thor ironers in all cities in the United States of over 100,000 population. She won second prize the first week, and first prize the second and fourth weeks and in addition, a check for $100 because she was the first woman in any group in the country making 2000 points in the contest. At the end she was declared the national winner and received a wrist watch, the grand prize given by Mr. Hurley.

* * *

The Women's Committee First Aid Team of the Portland Electric Power Company, Portland, Ore., gave a first aid demonstration, splinting and bandaging, under the direction of the Safety Engineer, at the meeting of the Lions Club of Portland, at the Multnomah Hotel, July 26. Musical numbers were furnished by two other women's committee members.

At the July meeting of the Missouri Gas and Electric Service Company, Norborne, Mo., Women's Committee, the girls had as guests the officers of several women's organizations of the city. Miss Verna Kull, chairman, presided and introduced several speakers among the girls themselves who talked on different phases of utility service. After the meeting refreshments were served.

* * *

A report by Miss Lillian Swanson, Northwestern Public Service Company, Huron, S. D., given at the last convention of the North Central Electric Association, should be a real inspiration to the many small groups throughout the country. Miss Swanson said:

> "We are somewhat handicapped by the small number of girls employed in our offices, and due to the fact that our towns are so widely separated it is not practical for several small groups to combine and function as one committee. Many of our offices employ only two girls. Some of the girls have been working in conjunction with the regular company employee meetings.
>
> "Committees have been organized and definite programs are being carried out in each of our four largest divisions, Aberdeen, Mitchell, North Platte and Huron. We have four girls in the Aberdeen office and by inviting in officials, salesmen or heads of departments they have been able to present well-rounded programs. The Mitchell girls, four in number, have solved their problem by inviting the wives of employees to their meetings so that they now have about eighteen members. The wives hold office, prepare talks and take part in the entertainment features.
>
> "There are only four in the group at North Platte but they are all interested in the work and have built up an enthusiastic committee. The Prime Movers, as they call themselves, recently entertained the Business & Profssional Club with a trip through the Northwestern Public Service Company plants, presented an informal program and served light refreshments."

* * *

A report from Miss Mae D. Brooker, Interstate Power Company, Lancaster, Wis., tells of a unique meeting held by the Dubuque, Iowa, group at Union Park, an amusement park owned by the company. Dinner was served to about fifty girls at a long banquet table on the refreshment pavilion. Following the dinner, the safety playlet "Never Say Die" was put on in which three of the girls demonstrated the Prone Pressure Method of Resuscitation. The life guards at the swimming pool gave demonstrations on how to rescue a drowning person. The five girls in the Wisconsin group were guests at this meeting.

* * *

Did-U-No-It is the title of the very interesting and comprehensive bulletin issued by the Women's Committee of the Public Service Company of New Hampshire, Miss Grace A. Phillips, editor-in-chief. The May-June number is a veritable magazine of some thirty pages, all filled with choice articles of interest to the Women's Committee. There is a story about a bridge party conducted by the Manchester, N. H., Business & Professional Women's Club held recently in the demonstration room of the Public Service Company. Just before the card playing, Mrs. Mildred Rees of the Edison Electric Appliance Company, stepped on the stage, which was set with an electric refrigerator, electric range and table, and displayed a dinner ready to be placed in the oven. She explained the operation of the range, placed the dinner in the oven and announced that dinner would be cooked while the card game took place, and at the close of the evening, would be awarded to the holder of the lucky number. Mrs. Josephine H. Pierce of the Eastern Service Refrigerator Company also gave a brief talk on electric refrigeration making particular mention of fancy desserts and ices that could be made in an electric refrigerator. Refreshments consisted of angel food cake baked in the electric oven and ice cream frozen in the electric refrigerator.

* * *

The News-Meter, San Diego Consolidated Gas and Electric Company, San Diego, Cal., in its July issue, contains a report of the Women's Committee meeting at the Pacific Coast Electric Association Convention. Mrs. Anna Steese Richardson, director of the Good Citizenship Bureau of the Woman's Home Companion, was a speaker. At the special Women's Committee session, there were delegates from every committee except Honolulu.

* * *

The July issue of *Snap-Shots,* Georgia Power Company, Atlanta, carries a story of the Women's Committee inspection trip in July. Headed by Miss Ruth Morris, chairman, a large group of women employees made the trip over several of the main Atlanta properties by motor coach. The sightseers visited Spring Street sub-station, Fulton County plant and Boulevard sub-station. At the Spring Street unit, they were shown how that automatic switching and transforming plant operates to serve a large part of Atlanta's residential section. At the Fulton County plant, they viewed the various repair and construction activities which are carried on there, seeing how street cars are repaired, etc. Boulevard sub-station, largest on the company system, also proved interesting as committee "tourists" looked over its huge switches and transformers.

* * *

Mrs. Gloria Rimbach, commercial artist in the Sales Department, Northern Indiana Public Service Company, at Hammond, has been appointed as official interpreter of the International Association of Identification, a world-wide crime prevention organization. The office of interpreter has just been created and Mrs. Rimbach is the first to hold it. She was appointed by James R. Wilkinson, of the Windsor, Ontario, Police Department, president of the international group. She is well fitted for the position since she speaks both German and French fluently and can read and write both languages. Her work will include, in addition to interpreting, correspondence to foreign identification officials and translation of letters from them. According to the present plans of the association, the 1930 international convention will be held at Montreal, Canada, where Mrs. Rimbach will have her first opportunity to act in her official capacity as verbal translator.

MAGAZINE ARTICLES

Below is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

- How to Take Care of Upholstered Furniture—R. R. Rau

RELATED and other ORGANIZATIONS

Illuminating Engineering Society Convention

MORE than 625 members and guests of the Illuminating Engineering Society registered for the twenty-third annual convention of that organization, held in Philadelphia, Sept. 24-27, the largest number that has ever attended a meeting of that society.

An innovation in this year's program was a pre-convention session for central-station lighting service engineers. At this session it was brought out that electric utility commercial men need not feel that undue concentration will be devoted to building up domestic business to the exclusion of other sales activities, because the illuminating engineers are on record to see that the lighting of great buildings, shops, factories and highways is not only kept up with the best practices of the day, but that such structures are adequately wired to meet the mandates of the future.

A symposium based upon a questionnaire submitted to seven utility companies gave an indication of probable costs to increase domestic sales. Several organizations figured that 10 to 20 per cent of an estimated increase in revenue might be justifiably expended to obtain that increase.

In speaking of general promotional lighting activities, A. A. Brainerd, Philadelphia Electric Company, said, "Since the central station receives the greatest benefit from high-quality lighting, it must be expected to bear the lion's share of the expense. I believe that the logical plan for the most efficient lighting service would be to have all interests involved pool their lighting specification work through the local electrical league in such a manner that the central station lighting service department will do the major part of the engineering work." Mr. Brainerd also suggested that "in the future we should place more effort on selling lighting as a complete system in the sense that ventilating and heating is a complete system.—"We need," he said, "lighting systems instead of installations, foot-candles instead of watts."

(Continued on page 685)

WHAT OCCURRED LAST MONTH

Agricultural

A survey by the Missouri Association of Public Utilities shows that 10,285 farms in Missouri now use electric service. This is an increase of 169 per cent in the last three years.

* * *

Colorado River Project

Two hundred thousand peak horsepower will be added to the output of Boulder Dam should the government follow the recommendations of a resolution adopted recently by the Los Angeles Department of Power and Water. The resolution asks that the height of the dam be raised from 550 ft. to 575 ft., giving as reasons: (1) Better flood control; (2) more complete regulation of the Colorado River; (3) large increase in power at a lower rate.

* * *

Governors of the seven Colorado Basin States held a conference at Salt Lake City on August 28-29, the principal subjects of which were the question of prices for Boulder Dam power and the granting of permits for power development on the river. The conference went on record as favoring "a fair price for power after all factors entering into the proposition of a basis for fixing a price are given due consideration," with special consideration given "to costs and charges for power in the competitive field." The conference favored continuation of the present embargo on power-permits on the river.

* * *

On Sept. 5 the International Water Commission, which has been meeting in Mexico City discussing disposition of the waters of the Rio Grande, Colorado and Tia Juana Rivers, announced that it would be unable to complete its work in Mexico City and would recess on Oct. 10, to reconvene in Washington, probably on Oct. 15.

* * *

Notices have been sent to prospective purchasers of power to be generated at Boulder Dam that their applications for such power must be filed with the Department of the Interior in Washington not later than October 1. Acting Commissioner of the Reclamation Service Dent explains that an allocation method will be adopted to apportion the power among the applicants. He declares, however, that states and cities have preferential rights of purchase.

* * *

The Metropolitan Water District Board of Directors of Southern California has chosen three engineers to select a route for the proposed Colorado aqueduct which is to carry water from the Colorado River.

* * *

On September 23, Secretary of the Interior Wilbur stated that the Reclamation Bureau had been instructed to study plans of Boulder Dam, with a view to building the dam twenty-five feet higher than was first planned. Commissioner Mead of the Reclamation Service expressed the view that the proposal is feasible and practical. He said that for each additional foot in height there would be made available a minimum increase of 150,000 acre-feet of storage space and a decided gain in power-capacity.

* * *

A Washington dispatch quotes Senator Pittman of Nevada as saying that Congress will be asked to grant a special immediate appropriation of between two and three million dollars to carry out preliminary work in the construction of Boulder Dam.

* * *

Consolidations, Etc.

An Insull subsidiary, the Midland Utilities Investment Company, has acquired control of the General Utilities Company, which supplies electric service to twelve communities in southern Indiana, and owns about 85 miles of transmission and distribution lines interconnected with the Interstate Public Service system.

* * *

The Columbia Gas and Electric Corporation has acquired control of the Cincinnati, Newport and Covington Light and Traction Company, an allied organization.

* * *

A certificate filed in the office of the Secretary of State of New York states that the International Power and Transmission Company, Lockport, has been merged with the Lockport Light, Heat and Power Company, by which it had been controlled.

* * *

A conditional offer for the common stock of the Columbus (Ga.) Electric & Power Company made by the Commonwealth & Southern Corporation has been accepted by the stockholders, and the Columbus company is now a subsidiary of that holding organization and allied with the Georgia Power Company and other constituent concerns of the Southeastern Power and Light.

* * *

The Elmira Water, Light and Railroad Company has petitioned the New York Public Service Commission for permission to transfer its franchises and electric and gas plants to the New York State Electric Corporation.

* * *

The American Commonwealths Power Corporation has acquired nearly all the outstanding common stock of the National Gas and Electric Corporation, a system with properties in Michigan, Ohio, Wisconsin, North and South Carolina, Colorado and Alabama.

* * *

The Harpers Ferry Paper Company announces that it has sold to the Insull interests its water-rights in Potomac and Shenandoah Rivers.

* * *

A statement issued by Senator Capper advocates legislation permitting consolidations and mergers only when good cause for such combinations can be shown. The statement declares that mergers should not be permitted unless it is shown that the public as well as the corporations will be benefited.

* * *

On September 9, Matthew S. Sloan, President of the N.E.L.A. and of the New York Edison and associated companies, in an address at New London, Conn., to the New England Division of the N.E.L.A., declared that mergers of operating companies and extension of holding company participation in utility development make for lower costs and greater efficiency and asserted that the advantages obtained by the utilities from these developments should be split with the customer in lowered rates.

* * *

The W. B. Foshay Company has acquired controlling interest in the Dixie Power Company, which serves eighteen communities in Washington and Iron Counties, Utah.

* * *

New York papers of September 25 say that the Public Utility Holding Corporation (recently organized by the Harris, Forbes banking interests and associates) has entered into an agreement with the E. W. Clark interests for the purchase of the Portland (Ore.) Electric Power Company.

* * *

Earnings of Utilities

Figures reported to the Department of Commerce from ninety-five public utility systems or companies, exclusive of telephone and telegraph corporations, representing all the important organization in the United States, show net earnings of $71,000,000 for July, as compared with $62,260,333 for July, 1928. Gross earnings for July were $178,000,000, as compared with $183,000,000 in June and $173,645,919 in July, 1928.

Federal Trade Commission's Investigation

On September 9 Senator Norris introduced a resolution to provide for the printing of all exhibits placed in the record of the Federal Trade Commission in connection with its utilities investigation, except copyrighted books, bulky volumes and other lengthy exhibits, of which descriptions and extracts would be printed.

* * *

The Electric Bond and Share Company and the Federal Trade Commission have asked Federal Judge Knox to appoint a special master to take evidence in the Bond and Share Case, this being in accord with the decision of the case rendered by Judge Knox some time ago.

* * *

Foreign

The $100,000,000 hydro-electric power propject on the Dnieper River, Russia, which is being constructed under the supervision of Colonel Hugh L. Cooper, is reported as half finished.

* * *

A dispatch from Berne, Switzerland, says that a water-power plant which will be completed in four years and will produce more than a third of a million horsepower is well under way near the Jungfrau. A dam 371 feet high, the highest in Europe, is being constructed. A series of falls aggregating 4,000 feet will be part of the project.

* * *

A New York *Times* dispatch from London says that the British Government has appointed a committee to report on the possibilities of a scheme to electrify the whole trunk railway system of Great Britain as an aid in relieving unemployment.

* * *

New York papers tell of the arrival of the Earl of Birkenhead and several associate financiers and business men who have come to the United States to study the operation and management of American public utilities with the purpose of getting information to help solve the problems of the electric power industry in Great Britain.

* * *

Hydro-Electric

Lieutenant-Colonel M. C. Tyler of the Army Engineer Corps has been appointed chief engineer of the Federal Power Commission.

* * *

The Federal Power Commission on October 28 will hold a public hearing on the proposed Flathead hydro-electric project in Montana.

* * *

A dispatch from Richmond, Va., says that the Garden Clubs of Virginia have announced that they are taking an appeal to the Virginia Supreme Court of Appeals from the decision of the State Corporation Commission that it has no jurisdiction in the matter of the proposed hydro-electric development of the North River at Goshen Pass. The Garden Clubs has protested the development, claiming it would be an injury to the scenic beauty of the region.

* * *

On September 4 the Gatineau Power Company commenced delivery of an additional 50,000 horsepower of electric energy to the Hydro-Electric Power Commission of Ontario. This quantity, scheduled for delivery on October 1, increased to 130,000 horsepower the energy now being delivered by the Gatineau Power Company to the commission.

* * *

The President of the California State Senate and the Speaker of the Assembly have appointed a Legislative Committee on Water Problems which will continue the work of a previous committee and will cooperate with the Joint Commission to be named by President Hoover and Governor Young for investigation of California's water-resources.

* * *

Authorities of British Columbia have granted approval to the British Columbia Power Corporation to proceed with its Campbell River power-project.

* * *

Colonel Thad H. Brown of Columbus, Ohio, has been appointed chief counsel of the Federal Power Commission.

* * *

The Holston River Power Company has filed with the Tennessee Railroad and Utilities Commission notice that preliminary work on the three dams to be constructed on the Holston River will be started immediately, this being preparatory to requesting the Federal Power Commission for a permanent license for the projects.

* * *

On September 22 Charles Reid of the Flood-Control Committee of the House of Representatives proposed a national conference on flood-control and waterway development which would attempt to secure united action by the Federal Government, the states and local interests.

* * *

In testifying in a suit at Macon, Ga., September 24, A. R. Graustein, president of the International Paper and Power Company, stated that the company had in mind a project on the Hudson River which would develop annually 500,000,000 or 600,000,000 kilowatt-hours of electricity.

Power Company Sells Newspaper Interests

On September 21 announcement was made by the management of the *Boston Herald* and *Traveler* that the International Paper and Power Company had agreed to sell all its stock in those papers to a group of bankers acting with the management of the papers. A public offering of the stock has since been made by the banking interests.

* * *

Maine

On September 9 voters of Maine, in a referendum ordered by the last Legislature, defeated the Smith-Carlton bill, which would have permitted export of surplus hydro-electric current and would have imposed a tax of 4 per cent on gross receipts from such export.

* * *

Municipal Plants

Grafton, N. Dak., has voted $77,000 for a new municipal electric plant.

* * *

The City Solicitor of Holyoke, Mass., in a report to the Mayor of Holyoke and officials of the Municipal Gas and Electric Department, declares that the plants of the department should be assessed and taxed as is private property, and that a reasonable rental should be paid for use of the department's quarters in the City Hall. He further says that some provision should be made to compensate the city for services rendered the department by officials paid by the city.

* * *

Muscle Shoals

Dispatches from Washington state that Senator Norris will make renewed efforts to secure passage of his new Muscle Shoals bill, which is substantially the same as that which was defeated by President Coolidge's pocket veto. The only important difference between the bills is that the new one provides that Alabama and Tennessee shall have a share of the gross receipts from the sale of power to recompense them for the loss of taxes which would be levied if Muscle Shoals were privately-owned.

* * *

A resolution adopted at the annual convention of the National Association of Power Engineers at Chattanooga, Tenn., September 18, urges that Muscle Shoals be developed under the supervision and ownership of the Federal Government.

* * *

On September 25 the Tennessee Electric Power Company announced plans for the construction of a transmission line to supply industrial and domestic consumers of Nashville with electric current from the Muscle Shoals plants.

New York State

On September 13 announcement was made of the acquisition by the Niagara-Hudson Power Corporation of the Frontier Corporation and of the St. Lawrence Securities Company. The Frontier Corporation owns property along the shore on the American and Canadian sides at the Long Sault Rapids, where it is possible to develop 2,400,000 horsepower, and the St. Lawrence Securities Company owns utility properties in northern New York. Announcement of the purchases brought statements from Governor Roosevelt, Senators Walsh, Capper, Wagner and Norris, and later statements from Thomas W. Lamont of J. P. Morgan & Company and Floyd L. Carlisle and Roy P. Stevens of the Niagara-Hudson Power Corporation.

* * *

Governor Roosevelt declares that the legal status of the St. Lawrence power question is not changed, and reiterates the Governor's views favoring state development of St. Lawrence power. Senator Walsh expresses fear that the purchase may hinder development of the St. Lawrence as a waterway. Senator Norris speaks to somewhat the same effect. Senator Capper believes that New York power interests may work against the waterway project from Chicago to the Gulf of Mexico. Senator Wagner points out that the situation with respect to the St. Lawrence development has not been changed by the purchase.

* * *

The statements by Mr. Lamont and Messrs. Carlisle and Stevens indicate the readiness of the Niagara-Hudson Corporation to cooperate with the state and Federal governments in development of the St. Lawrence and in distribution of power in a manner for the best interests of the people. They state that the company has taken no stand on the question of public or private development of St. Lawrence power and bring out that a proper power development will not interfere with a St. Lawrence seaway project.

* * *

Production of Electricity

According to the United States Geological Survey, the total amount of electric current produced by public utility power plants producing 10,000 kilowatt-hours or more per month was 8,011,000,000 kilowatt-hours in July. This compares with 7,768,000,000 in June and 7,142,000,000 in July, 1928.

* * *

The Department of Commerce on September 25 announced that, according to data collected at the quinquennial census of electric industries and the biennial census of manufacturers taken in 1928, the total output of electric current in the United States (not including outlying possessions) in 1927 amounted to 102,759,753,811 kilowatt-hours. Of this total, 74,686,378,010, or 72.7 per cent, came from central electric stations; 20,558,426,000, or 20 per cent, from manufacturing establishments; 2,975,863,293, or 2.9 per cent, from electric railways; 844,780,315, or .8 per cent, from electrified divisions of steam railways; and 3,694,306,193, of 3.6 per cent, from "isolated" plants. The leading producing states, in order of production, were New York, Pennsylvania, Illinois, California, Ohio and Michigan.

* * *

Public Lands

Drastic changes in the relations between the Federal and state governments in respect to public lands and reclamation service were suggested by President Hoover in a letter to Joseph M. Dixon, Assistant Secretary of the Interior, made public at a meeting of the governors of the public land states in Salt Lake City, August 26. President Hoover's idea is to bring about a greater measure of control by the state governments themselves. President Hoover wrote in part: "Generally, I may state that it is my desire to work out more constructive policies for conservatism in our grazing lands, our water storage and our mineral resources, at the same time check the growth of Federal bureaucracy, reduce Federal interference in affairs of essentially local interest and thereby increase the opportunity of the states to govern themselves and in all obtain better government."

* * *

Railway Electrification

Thirty-five electric switch engines have been bought by the New York Central for use on the west side in New York City.

* * *

Dispatches from Detroit tell of definite plans for the electrification of the Grand Trunk lines between Detroit and Pontiac, Mich., and the construction over the electrified railway lines of a motor speedway.

* * *

Rates

A new schedule of rates for Niagara Falls, filed for approval with the New York Public Service Commission by the Niagara Electric Service Corporation, provides a reduction in excess of 10 per cent to take effect September 4. The new schedule, which the company estimates will bring a saving of $110,000 a year to its customers, on the basis of present consumption, substitutes the present Buffalo power rates for those now charged in Niagara Falls.

Authority has been given by the Board of Railroad Commissioners of North Dakota to the Otter Tail Power Company to standardize its electric rates throughout the state. The company has filed one series of schedules applicable in cities of 2,500 or more population, another series applicable in towns of from 800 to 2,500, and a third series in towns of 800 or less. Eleven different schedules are contained in each series, consumers being given an option as to which schedule they prefer.

* * *

The Kansas City (Mo.) Power and Light Company has filed a voluntary reduction of its residential and commercial lighting rates which will save approximately $360,000 per annum to customers in Kansas City and vicinity.

* * *

The Hartford (Conn.) Electric Light Company has announced that customers will be rebated 60 per cent of their October bills, employees will receive as extra compensation 60 per cent of their October wages, and stockholders as of October 20 will get, as an extra dividend, 60 per cent of their October dividend accrual. The total extra payments thus provided will be about $536,000, of which $350,000 goes to consumers.

* * *

Mayors and other city officials of Georgia have formed the Municipal Utilities Rate Association with the announced purpose of protecting "the interests of gas and electric consumers."

* * *

The Public Utilities Vermont Corporation has filed a schedule reducing rates for residential and commercial lighting in the Richford district.

* * *

The Nebraska Light and Power Company has announced reduced rates for McCook, Neb.

* * *

The Winsted (Conn.) Gas Company has announced a new schedule of electric rates which are particularly advantageous to large domestic users, who are expected to save approximately 40 per cent on household bills.

* * *

The City Council of Wilmington, N. C., has filed with the North Carolina Corporation Commission a petition asking lower gas and electric rates for Wilmington.

* * *

The Fort Dodge (Iowa) Gas and Electric Company announces reductions in rates which will save $27,000 annually to consumers. This is the second reduction announced by the company this year.

The Public Service Commission of Maryland has fixed at $115,000. instead of $137,500, the gross reduction in the rates of the Eastern Shore Gas and Electric Company.

* * *

The Southern California Edison Company has announced a voluntary reduction in rates for lighting which will save consumers about $1,400,000 a year.

* * *

The Brockton (Mass.) Edison Company has announced a reduction in rates for consumers using more than 150 kilowatt-hours.

* * *

The New Mexico Public Utilities Corporation announces reduced rates for Gallup, N. M.

* * *

Regulations, Etc.

Alleging that if the decision of the Nebraska Supreme Court is allowed to stand it will result in establishing a monopoly at Hartington, the Interstate Power Co. has asked that tribunal for a rehearing in the case where it was permanently enjoined from putting in a 6-cent rate in competition with a plant built by another company under a contract to turn the plant over to the city when cost and interest were repaid out of future net earnings.

* * *

The California Railroad Commission has forbidden the Coast Counties Gas and Electric Company to refinance its properties, on the ground that the reproduction cost new might exceed the original cost, which the commission has previously permitted to be capitalized through the issue of stocks and bonds.

* * *

The National Association of Railroad and Utility Commissioners, in annual convention at Glacier National Park, Montana, went on record as opposed to creation of any new Federal agencies interfering with the regulatory powers of the states in fields where the states now practice regulation. The resolution on this subject expressed opposition to the Couzens bill.

* * *

On September 4 Secretary of War Good declared that a study of the water-power problem, such as contemplated in the Couzens bill, should be undertaken. He expressed approval of the provision in the bill which would reorganize the Federal Power Commission by eliminating the Secretaries of War, Interior and Agriculture as members and constituting an independent body of five members.

* * *

Speaking at the New York State Fair at Syracuse on August 29, Governor Roosevelt attacked the inequalities and lack of standardization of telephone and electric rates in New York State, with particular application to rates for rural service. He advocated more uniform rates. He also expressed the view that the question of whether savings promised by mergers have been translated into better service, cheaper and more uniform installation costs, lower rates and simplification of contracts should be investigated.

* * *

A private conference of the six New England Governors and members of the New England Council held at Springfield, Mass., on September 17, discussed water power control and the interstate transmission of power.

* * *

St. Lawrence Project

A dispatch from Montreal says that construction work has been started on the power-project of the Beauharnois Light, Heat and Power Company on the St. Lawrence River.

* * *

In an address to the delegates to the Atlantic Deeper Waterways Association, held at Poughkeepsie September 18, Representative Hamilton Fish declared the St. Lawrence project impracticable, and characterized the all-American route by way of the Hudson as feasible and practical.

* * *

On September 20 Secretary of War Good, addressing the Atlantic Deeper Waterways Association in session at Albany, advocated complete development of the nations inland and coastal waterways, including the St. Lawrence project. The association itself adopted a resolution favoring a waterway between the Great Lakes and the Hudson River of sufficient dimensions to accommodate through shipping between the lakes and the seaboard without breaking bulk.

* * *

At its annual meeting at Duluth. Minn., the Great Lakes Harbor Association pledged itself to a renewal of its effort for construction of the St. Lawrence waterway, and also for maintenance of the water-levels of the Great Lakes.

* * *

Taxation of Utilities

The bill which requires that public utilities other than railways be subject to the income tax and that property taxes of electric, gas and water companies extending into two or more assessment districts be at the state rate instead of the local rate has been signed by Governor Kohler of Wisconsin.

SURGES AND FLASH OVERS

By Fred W. Herbert

Director, Service Department, NELA

There are no free scholarships in the school of experience.

Answer to the question whether pants is singular or plural: When men wear pants it's plural; when they don't it's singular.

LEGAL DECISIONS from RATE RESEARCH

EDITOR'S NOTE: *Rate Research,* which is published weekly by the Rate Research Committee of the National Electric Light Association, sets forth those decisions of various courts and Public Service Commissions which are of immediate interest to the light and power industry. It does not attempt to publish all such decisions. Decisions not directly connected with the industry are often published if, in the opinion of the editors, the principles involved are of importance.

It is believed that the publication, from month to month, of comments upon some of the leading cases, free from legal phraseology, will be useful. Public utility law is comparatively new, and everyone connected with public service enterprises should have an understanding of the trend and significance of these commission and court decisions.

For these reasons, the N.E.L.A. BULLETIN will carry each month, brief comments on some of the leading cases reported by *Rate Research* as coming before either State or Federal courts or Public Service Commissions.

A Business, As Such, Cannot Be Made a Public Utility by Process of Law

The United States District Court for the Western District of Oklahoma has recently set aside the statutes of Oklahoma declaring cotton gins to be public utilties and subject to regulation by the Oklahoma Public Utility Commission. This means that legislation cannot declare a business a public utility when it is not such in fact and is in accordance with the principles of constitutional law as laid down by the Supreme Court of the United States.

Utilities Cannot Be Compelled to Give Service to Competitors

The Supreme Court of Missouri has recently held that it is neither just nor reasonable to compel a utility to furnish service to be used in competition with its own business. In the specific case before the court a customer of a water company demanded additional service, his purpose being to supply other consumers with water which they could secure directly from the water company.

Exporting Electric Current

Very few States have laws similar to that of the State of Maine designed to prohibit the export of electricity, there being almost universal recognition of the mutual benefits to both the exporting and importing States.

Recently the Public Service Commission of the State of New Hampshire received a request from the Grafton Power Company for permission to export electricity, which was granted upon the following conditions: The exporting company must furnish service within the State at reasonable rates and upon terms as favorable as those granted to consumers outside the State, having due regard to all conditions surrounding the furnishing of service; if, in the future, the electricity which was being exported should be required within the State, the Commission would have the power to so order; and, the Commission is to retain jurisdiction over contracts made and to be made.

At the hearings it was shown that the developed power was more than is needed in New Hampshire at present, and that the request, if granted, would result in an interconnection with a large transmission system capable of rendering additional or emergency service in New Hampshire in case of need.

Effect of the O'Fallon Decision in Indiana

The Indiana Public Service Commission has recently set aside an order (issued some years ago) to the effect that it would base its valuations of interurban, motor bus and street railway properties only upon original or "historical" cost and now holds that in order to arrive at a "legal" valuation it is necessary to consider all pertinent evidence as to the cost of reproduction and the cost of reproduction depreciated.

This decision recognizes the so-called "O'Fallon Decision," in which the United States Supreme Court annulled an order of the Interstate Commerce Commission in the case of the "St. Louis and O'Fallon Railway Company and Manufacturers' Railway Company vs. United States and Interstate Commerce Commission," on the ground that the Commission failed to consider present cost of construction or reproduction as one of "the elements of value recognized by the law of the land for rate making purposes," as directed by Section 15a of the Interstate Commerce Act (added thereto by the Transportation Act of 1920).

Changing from Direct to Alternating Current

The New York Public Service Commission has held that the fact that hereafter all new buildings in particular districts within the area served by the New York Edison Company will be required to install alternating current elevators does not constitute discrimination.

This recognizes the policy of the company to restrict the use of direct current, as far as possible, to those localities where direct current is now generally supplied, and wherever possible to substitute alternating current.

A Utility Not an Insurer of Continuous Service

The Supreme Court of Wisconsin has held that a public utility cannot be held liable for interruptions to its service when such interruptions are due to conditions over which it has no control, provided that it has exercised reasonable and practical care, as well as foresight and diligence to prevent such interruptions.

Public Relations Meeting

(*Continued from page* 673)

tics. These services are being sent to executives.

Mr. Oxley stated that the movietone films of Mr. Edison, Sir Ernest Benn, Sir Kengo Mori and Signor Alberto Pirelli, and the convention film, are proving a tremendous success, the films being completely booked for September and October. In spite of the fact the association ordered two additional prints of Sir Ernest Benn and Mr. Edison, a total of five prints of these two films, the association has been unable to fill all requests.

The statistical chapter of the N. E. L. A. Handbook has been revised and copies are being forwarded to all who received the handbook. Mr. Oxley also stated that in accordance with the instructions of the Section's Executive Committee at its last meeting, the address by Martin J. Insull on "Complete Service" was published in the N. E. L. A. BULLETIN and also in pamphlet form and forwarded to all executives. The budget of the section has been approved by the officers of the section and has gone to the Budget Committee for consideration and approval.

Upon motion by Mr. Owens, seconded by Mr. Herrington and carried, the following appointees to represent the Public Relations National Section on the Public Policy Committee were approved: Harry Reid, T. A. Kenney, Guy W. Talbot and D. C. Green.

Back Numbers of N. E. L. A. Bulletin Available

A FORMER member of the N. E. L. A. who has been retired on pension by his company writes that he has unbound N. E. L. A. Bulletins, covering a period of several years, which he will dispose of for a nominal sum. The years covered are 1922, with the exception of the April issue, and 1923 to 1928 inclusive. He also has the proceedings of the Pennsylvania Electric Association for 1919 to 1927 inclusive.

Anyone interested may address the editor of the Bulletin and the letter will be forwarded to the owner of the books.

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Electricity Supplants Harpoon in Whaling

THE U. S. Department of Commerce has announced a new invention for killing whales by electricity which is said to have been perfected by a Norwegian engineer. It has been tried out recently in practice near the Faer Islands.

The full text of the Department's statement is as follows:

"It is thought by those interested that the new invention will revolutionize the catching of whales from both the points of technic and economy. Installation of the necessary machinery is estimated to cost less than 3000 kroner (about $700), and several of the boats expecting to participate in this season's catch are already having the new equipment installed.

"The advantages of the new method are several, one of the most important of which is the instantaneous death of the whale, even if hit in a spot not ordinarily mortal. Furthermore, the dead whale remains floating, while by the old methods the whales usually sink and the lifting of them causes much loss of time and wear and tear of machinery.

"A stock company has been formed to exploit the new invention. The board of directors consists of several well known men in the whaling industry, besides the inventor. The company controls eight or nine patents, and patent rights will probably be rented by payment of royalty on each barrel of oil extracted from whales killed by the new method."

New Orleans Prepares for Mardi Gras by Installing Fine Lighting System

IN anticipation of the Mardi Gras of 1930, New Orleans is planning the installation of one of the finest lighting systems in the country on its wide and picturesque business thoroughfare, Canal Street. From the river, through the business section for a distance of more than a mile, 108 handsomely designed lighting standards with three 1000 watt lamps on each, will be spaced to illuminate the 180 foot wide street with brilliant light. The standard will be placed in the neutral ground alongside the trolley tracks, between the roadway and the tracks.

Talking Movies of N. E. L. A. Convention Shown in London

POINTING out that the talking motion picture films of speeches by Sir Ernest Denn, the noted English Economist; Dr. Alberto Pirelli, president of the International Chamber of Commerce, and Thomas A. Edison, which were shown at the annual convention of the National Electric Light Association in Atlantic City, represented the first employment of the sound film by an industry, P. L. Thomson, director of public relations of the Western Electric Company, gave the first public showing of these films in London, August 27.

Commenting on this use of the "talking movie," the *Electrician* (London) says: "The first notable use of the talkie outside the entertainment field was that made by the National Electric Light Association of America when it obtained talking films of the distinguished men in other countries, rushed the films over to the States, and reproduced them as part of the business program at their annual convention in Atlantic City, in June. Speakers whose voices were heard in this way included Sir Ernest Benn (chairman of Benn Brothers, Ltd.), Signor Pirelli, and T. A. Edison * * *

"J. H. McGraw (chairman of the board of McGraw-Hill Company), who had heard the speeches reproduced at the Convention, testified to the remarkable effect produced by them on the American delegates, and predicted that the 'sound picture' would become one of the greatest factors in promoting international good feeling and understanding."

Lord Birkenhead on Electrical Progress

IN an interesting statement appearing in the New York *Times* of Sept. 19, the Earl of Birkenhead, chairman of the Greater London and Counties, Ltd. (British affiliate of the Utilities Power and Light Corporation), expresses the opinion that "industrial development goes hand in hand with the progress of electric energy," and says that most of his countrymen have noted with interest the great industrial development in the U. S. and its consequent prosperity.

Discussing the causes of the decrease in the United States of production costs, Lord Birkenhead credits the construction of great electric generating stations at strategic locations with being the most powerful factor in bringing about these reductions. "The superpower system," he said, "has enormously extended the area within which energy is distributable and rendered possible the interchange of facilities with other power stations."

After commenting on the increase in the use of electricity in the home and on the farm in this country, he stated that a cheap and abundant supply of electricity is the aim in Great Britain. "We feel that this will have a beneficent effect upon British industry," he added, "and tend to alleviate the unemployment problem and place Great Britain in a better position to compete in the markets of the world."

I. E. S. Convention

(*Continued from page* 679)

An entire session of the convention proper was devoted to "Light's Golden Jubilee," C. H. Sharp acting as chairman. Dr. Elmer A. Sperry, E. J. Cattell of Philadelphia and Representative C. A. Eaton gave reminiscences of the inventor and paid tribute to him.

An analysis showing the relation of light to power in twenty industrial plants was offered by H. E. Cook, Detroit Edison Company, at the Wednesday session. Mr. Cook concluded that "power installations are in general constant in capacity, whereas lighting affords a variable and hence an opportunity for additional revenue through the increase which is procurable by increased efforts at saturation on the part of the serving utility."

Two sessions were devoted to the consideration of daylighting factors, designs and practices in illuminating engineering work, effects of ultra-violet radiation and the influence of window materials, synthetic sunlight and photoluminescence.

Entertainment features included the president's reception, a visit to P. S. du Pont's illuminated fountain and gardens, a banquet on Thursday evening and a golf tournament. Officers for the coming year were announced as follows: President, H. H. Magsdick; vice-presidents, W. F. Little and Julius Daniels; treasurer, C. L. Law; general secretary, E. H. Hobbie.

THE PRESIDENT'S PAGE

Bargains In Electricity

WITH investment costs per kilowatt of installed capacity rising and revenues per dollar of investment falling, the serious need of the power and light industry is increased sales.

It has been said of us many times that we are good engineers but poor salesmen. Under the circumstances, there may be profit in considering advice addressed to us by one who has made an outstanding record both as manufacturer and salesman. Henry Ford recently declared:

"Get electricity across to the people by the same way that automobiles got across to them. Create a desire for what electricity will do for them—You are not selling companies. You are selling electricity for what it can do in homes, shops, on the highways or on the farm."

Have we created a desire for what electric service will do for people, more particularly what it will do in homes, where we lag in sales and where increased business can be most profitably handled? Have we adequately sold the advantages and merits of electric service?

We have not. The proof is obtainable in sales figures, in the number of under-equipped homes, and in the attitude of mind of a large proportion of domestic users.

We have excused our inadequacy on many grounds. Analysis of the industry's statistics indicates that the time for excuses has ceased and the time for action is at hand. I suggest:

1. Aggressive selling of the advantages, merits and benefits of electric service.

2. Rate structures built to stimulate sales by putting a premium of lower price on increased use of current.

3. Faith in the common sense of the American people who don't turn down a bargain when they see one.

We have bargains to offer. Why not make the consumers see them?

President.

News from the Geographic Divisions

THE BULLETIN is glad to announce that, with this issue, a systematic reporting of news of the Geographic Divisions is inaugurated. The secretaries of the several Divisions have been invited to contribute each month a news letter of association activities within their respective divisions. At the time of going to press most of them had responded accepting this duty, with half of them sending their contributions with the letters of acceptance.

We believe that such pictures of the nationwide activities of the association as will be reflected in the Geographic Division news letters will make both interesting and valuable reading. While in most cases each division publishes its own organ, distribution of thee magazines is usually limited to these divisions in which they originate. Most of the divisional activities have more than a local appeal, and all should have a stimulating effect upon readers everywhere.

Young Demostheneses

THE chief worry of many a man has been his lack of ability to stand on his feet and tell a group of people what he thinks. Brilliant conversationalists—oftentimes—when only two or three people are around, they find themselves either as dumb as an oyster, or as red as another succulent denizen of the deep, when called upon to address a meeting. And the pity of it is it is so unnecessary, we are told.

In the final analysis a speech is but a variety of ordinary conversation. A little louder in tone, a little more thought about what one is to say, and if desired, a bit more of a gesture for emphasis—and that's all there is to it. Every man and woman is a potential public speaker. Not all of them are capable of becoming spellbinders, but at least most of them, some say all, can develop into creditable speakers.

The electrical industry is fortunate in having a goodly share of articulate representatives, and for this the National Public Speaking Committee and its subordinate committees are in a great part responsible. Through their encouragement and leadership thousands and thousands of employees of the industry have been enabled to enjoy that cocky feeling that comes after a message has been triumphantly put across an audience. The National Employee's Speaking Contest now getting under way will open the eyes of thousands more to the possibilities that are theirs in the way of public speaking. The contest deserves the support of every member company executive. From the purely selfish standpoint it will pay big dividends.

Notes on a Golden Day

NEWSPAPER readers everywhere were delighted to read on Oct. 24 that Mr. Edison had reached his New Jersey home in fine spirits and excellent health. As the hero of the most remarkable tribute ever accorded a human being he was bound to have been under a tremendous emotional and physical strain. His ability, at eighty-two years of age, to see through, so graciously and modestly, the program of that exciting day fifty years after his gift of electric light to the world, is in itself as marvelous a thing as any of his world changing inventions.

* * *

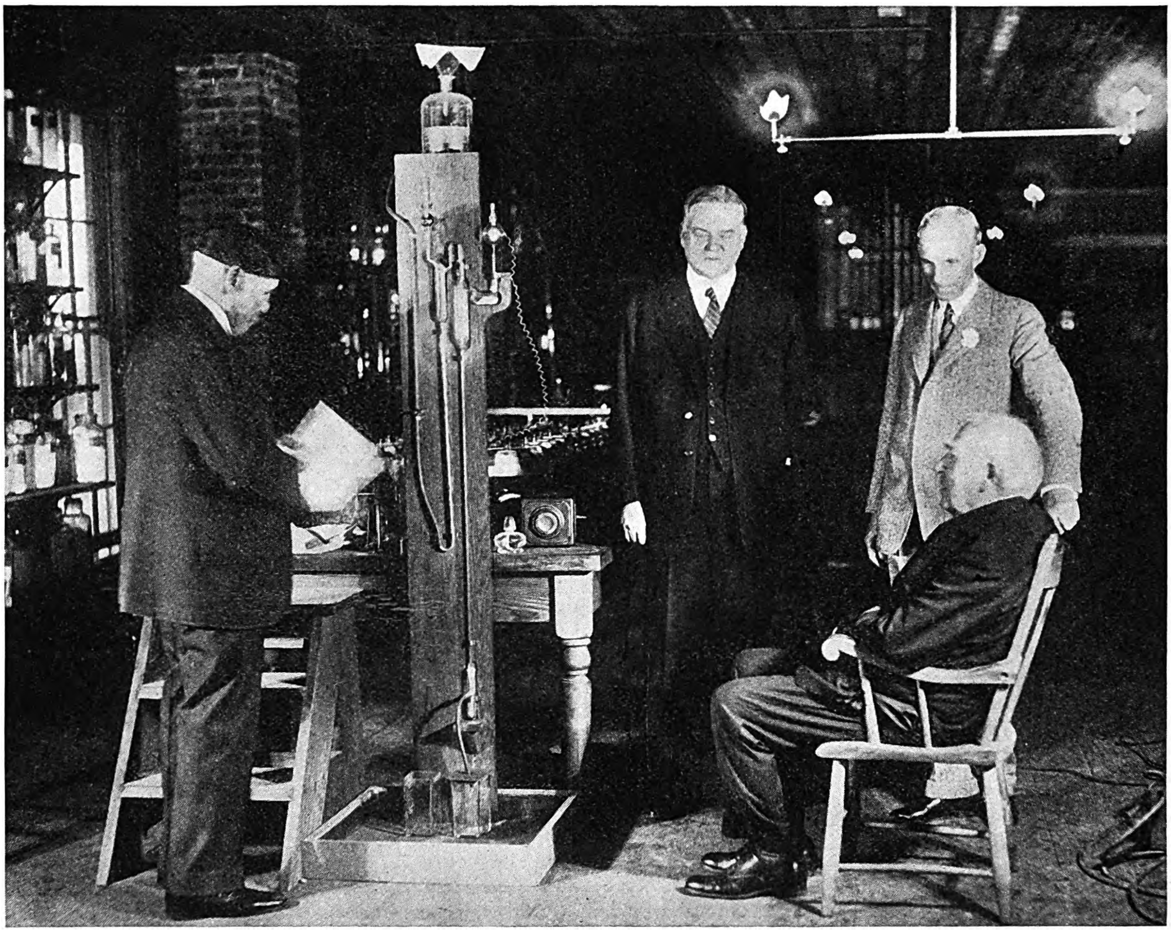
Without doubt every man and woman of the electrical industry felt a very special thrill over the fact that they were participating in one way or another in this splendid gesture of affection and gratitude to the Father of the Industry. Most truly in honoring him, we honored ourselves.

While we of the industry may pardonably feel that the Jubilee had a little more intimate a meaning for us, the rest of the world is not disposed to agree. The celebration was the feature of all the newspapers, scarcely a magazine of any type failed to comment and add its encomium, and the great and the humble of practically all countries joined in praise by telegram, by letter and by word of mouth. But of all of them, Mr. Ford paid the greatest tribute, not necessarily because he was host on Oct. 21, but because of his founding of the Edison Institute of Technology with all that it will mean to the present and to future generations.

Inspired by Edison's greatness, and typical of the urge in countless others, to do homage, the poem by Mrs. Bridewell and the drawing by Miss Greenwood on page 693 of this issue, aside from their intrinsic merits, are interesting because of the fact that the first is by a Louisiana grandmother of seventy years, and the other by a New York maiden of nineteen.

* * *

As might have been expected Will Rogers gave the complete epitome of the party at Dearborn. Remarks Will to Mr. Ford: "When you have been where Otto Kahn and Charles Schwab don't even sit at the speaker's table, *you have been to some banquet.*" And then, as Will bids Mr. Ford goodnight, "I don't want him to think I was being funny either. You see the biggest man in America was sitting there tonight and every one was humble because they knew Edison was a bigger man than they were."



A Historic Moment Recaptured

Francis Jehl, Edison's assistant at the original experiment, President Herbert Hoover, Henry Ford and Thomas Alva Edison at the recreation of the lamp which magically awakened the world to a new brilliance fifty years ago. The wizard of Menlo Park reconstructed the lamp in the same laboratory, now removed to Dearborn, Mich., in which he made his original experiments.

N·E·L·A· BULLETIN

November, 1929 Vol. XVI No. 11

All the World Joins in Tribute to Edison

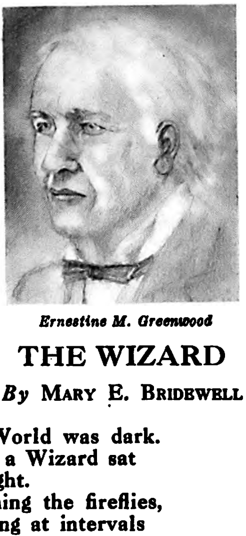
ALL the world knows of the unparalleled tribute to Thomas A. Edison which came to a glorious climax on the night of Oct. 21, and most of the world participated in it. Nevertheless, it is eminently fitting to attempt to give, in these columns, a picture of the most remarkable demonstration of affection and gratitude ever accorded a living man.

The first formal suggestion for the celebration of Light's Golden Jubilee was made at a luncheon of the Edison pioneers of Feb. 11 of this year, Edison's eighty-second birthday. The suggestion was received with the greatest enthusiasm everywhere, and early in June its observance began with the Edison Day program at the 52nd Convention of the N. E. L. A. at Atlantic City. From that time until the party at Dearborn there was a continuous round of local celebrations in all parts of the country.

But all this was but a foretaste of what took place on October 21 at Dearborn, Mich.

Old in years, but youthful in spirit, Mr. Edison relived that historic moment when he, at 32 years of age, yet already famous, produced fifty years ago the first practical incandescent lamp in his laboratory in Menlo Park, N. J. And though he was many hundreds of miles from the Menlo Park of geography, the moment was spent in the same laboratory, on the same sod and amid the same surroundings.

For his friend, Henry Ford, had spent several million dollars that the old laboratory might be restored at the village of Greenfield in Dearborn, with such attention to detail that Edison, as he surveyed it, could express wonder as he found reminder after reminder of the old days.



Ernestine M. Greenwood

THE WIZARD

By Mary E. Bridewell

The World was dark.
Alone a Wizard sat
At night.
Watching the fireflies,
Flashing at intervals
Their weird spontaneous
Light!
Thought's magic, caught
The secret,
Of the firefly's living spark,
And wrought the miracle,
Of instant Light
To dissipate the dark!
Now, every hamlet, every tower,
Flashes far reaching
Beams,
While every land blesses
The Man
Whom God fused with
Miracle schemes!
The summer nights, have
Always flashed,
The firefly's scintillant
Glee,
But Edison alone, could
Vision from its flickering
Spark,
Immediate, World-wide Electricity!

But the comparison with that day back in 1879 ended with the physical surroundings. Then there was no gathering of the world's great men hovering about, no batteries of newspaper men, no gaping crowds.

At this anniversary celebration the President of the United States was there. Leaders in many walks of life, particularly of science, of business and of finance, come to honor the man who had made possible, in many cases, the occupations in which they have won their own successes.

The festivities of the day began with the arrival of President and Mrs. Hoover on a special train at 9.30 in the morning. The presidential party was met at the train by Mr. and Mrs. Ford, Mr. and Mrs. Edison and Mr. and Mrs. Edsel Ford. They boarded a replica of an early Grand Trunk line train and were taken on a jogging, jumpy trip of half an hour to Greenfield. The President and Mrs. Hoover rode in the baggage car where Mr. Edison reenacted the scene that led to his dismissal as a Grand Trunk newsboy and accidentally put him on the trail of the electric bulb.

Mr. Edison published, printed and sold the "Herald," a train paper, from which he made a precarious living, selling fruit and candy and stoking the wood-burning engine between times to help out. He had rigged up a laboratory in one end of the baggage car and everything went well until one day some of his chemicals exploded and set fire to the car. That occurred at Smith's Creek station, near Dearborn. The incensed train crew ejected young Edison and unceremoniously fired him on the spot.

Mr. Edison thereupon took up telegraphy, starting at Smith's Creek station. The train today stopped at the same identical station, which had been moved, brick by brick, to Dearborn by Mr. Ford as part of his early American village. The village is a revival of a typical American settlement of pre-Civil War days.

The Lincoln court house has been removed intact from Lincoln, Ill., where President Abraham Lincoln practised law before his election, to Greenfield. It occupies an important place on the village green. On the other side is the original Clinton Inn, where James Fenimore Cooper, Daniel Webster and other noted travelers, stopped at Clinton, Mich., in 1832. It was the terminus of a day's journey west from Detroit in the old days.

A typical Town Hall stands at the foot of the green facing the village church. One of the oldest structures in the community is the village post-office. It was erected 126 years ago in Phoenixville, Conn., two years after Thomas Jefferson became President. Half post-office, half drug store, this old building has one of the strongest tangs of the past with its echoes of political debates and personal championings of favorite candidates and issues. Doors and wooden shutters are of age-worn planks studded with hand-forged nails.

The Whittier tollhouse and cobbler shop near by, mentioned in Whittier's poems, "The Countess," "The Toll-Man in His Cobbler's Stall," "The Smoking With Closed Eyes." Once it stood on the banks of the Merrimac River beside the bridge that linked Rocksvillage with West Newbury, Mass.

There also was a country store that faced the town of Waterford, a few miles north of Pontiac, from 1854 on. As in the case of the drug store, down at the postoffice, this general store is already equipped with an inventory of goods of every description just as was carried fifty to seventy-five years ago.

The railroad station is at the end of a winding road running at right angles from the village green.

Outside the station, on the track, steam up and ready to go, was the wood-burning locomotive, its bell-shaped smokestack chugging, behind it three cars of antique design. This engine came of a notable family. It is a sister locomotive of the famous "General" which was captured from Union troops by Southern forces during the War of the States.

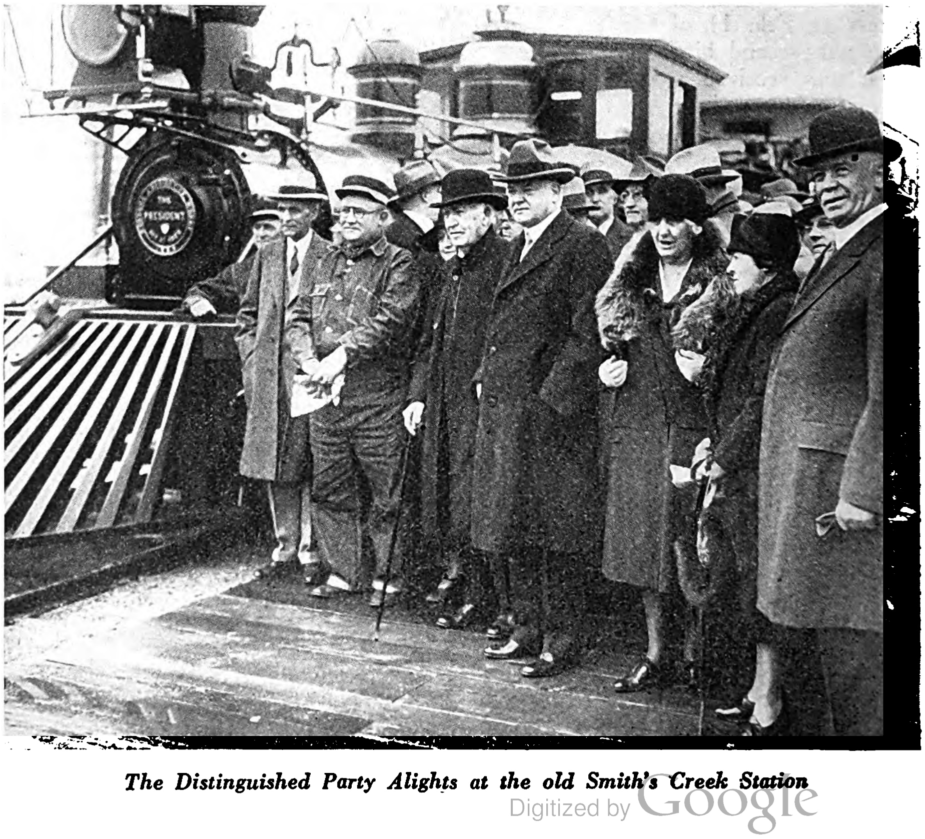
Mr. Ford, when he was a boy, knew an engineer named Sam Hill, who drove on the Michigan Central through Dearborn. His speed proclivities gave rise to the expression, "He goes like Sam Hill." Records of Hill's employment and death are in the Ford files. So the old locomotive become the "Sam Hill."

In other parts of the village stand the actual village blacksmith shop, a carding mill, a grist mill of the date of 1816 and a sawmill of the same date; a village machine shop, a livery stable filled with carriages of all types and ages; a typical log house of Michigan pioneer days and several actual dwelling houses, all removed from their original settings to take their places as living quarters for those who will study and find employment in this most unique of communities.

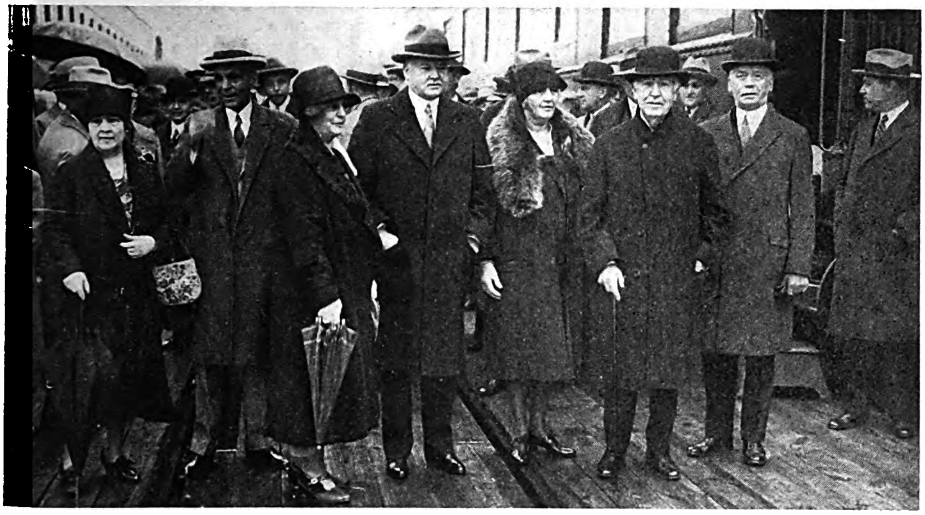
In this little village, now called Greenfield, which will become part of the laboratory of the Edison Institute of Technology, there gathered the 500 guests of Mr. Ford, come to pay tribute to the grand old man of electricity.

The day of tribute to Mr. Edison will never be forgotten by any who were privileged to be present. On the lower floor of "Independence Hall" (an enlarged reproduction of Independence Hall in Philadelphia), which is to form the central museum of the Edison Institute, the guests of Mr. Ford sat down to dinner to the strains of the early American orchestra. At 7.30 p. m. Mr. Edison, President Hoover, Mr. Ford, Owen D. Young and a small party left the hall and drove to the laboratory building and there re-enacted the lighting of the lamp. Here Francis Jehl, playing his part of fifty years ago, was occupied as he was then in operating the mercury pump to evacuate the lamp under test. Mr. Edison entered and tried the lamp with battery current. It flashed for only an instant before he broke the circuit and told Mr. Jehl that the vacuum was not yet good enough. Finally the bulb was satisfactorily evacuated, and Mr. Edison prepared to give in the final test of operation with current from a dynamo. He left the laboratory and went over to the machine shop in a neighboring building where the generators are installed. Steam was ready in the original Babcock & Wilcox wood-fired boiler. The nine bipolar dynamos driven by belts coming up through the floor from line shafting below began to spin as Mr. Edison opened the throttle on the single-expansion Brown engine, which is a replica, as the original could not be found. Then the party returned to the laboratory, where Mr. Jehl had sealed off the bulb. Mr. Edison made the connections. The lamp burned—a bright symbol of accomplishment illuminating the faces of the aged inventor and his co-worker as it did half a hundred years ago, when it was only a symbol of hope and those same faces were youthful and unlined.

Every step in the ceremony was described by Graham McNamee over the radio to those at the banquet and to the countless unseen audience that listened in on this eventful night. Suddenly, as Mr. Edison connected the old battery to the lamp, the rich glow of hidden electric floodlights sprang into life in the great candle-lit corridors of Independ-



The Distinguished Party Alights at the old Smith's Creek Station



On the Platform of the Station

ence Hall, and a thrill ran through the assembly as the "Liberty Bell" in the tower began to ring glad news that history had been remade.

At the conclusion of the re-enactment of the historic scene the party returned to Independence Hall, where Owen D. Young, acting as toastmaster, introduced W. S. Barstow, president of the Edison Pioneers; Mr. Ford, Mr. Edison and Albert Einstein (over the radio from Germany) for short addresses. Mr. Owen D. Young, speaking as toastmaster, then said:

> "Mr. Edison, to express what is in the hearts and minds of all who hear my voice, my first word must be not one of appreciation of your great inventions or of the service which they have rendered, but rather one of congratulation on that vitality of spirit which makes you do what you do. You come to Greenfield Village today, adventuresome still, as if life lay all ahead of you and none behind. To be sure, the passengers on your railway train took a little more notice of you than they did seventy years ago when you tried to sell them papers. The greeting at Smith's Creek depot was a little warmer than on that memorable day in 1861, when the railroad people dispensed with your services because you set fire to their cars with this same vitality of which I speak, aided by a little phosphorus.
>
> "That was a great day for the electrical industry; one might say that that industry was largely born at Smith's Creek depot. The same unconquerable will and unquenchable fire which took you out of that depot and set you on your career brings you back to it today, defying the years that have since gone by. It was that vitality of spirit which forced your head to conceive and your hands to execute, which defied sleep as you now defy age. But it did not work alone on your mind and body, and that, I suspect, is the secret of your great success. It worked on and through your heart, and that I know is the secret of this meeting today. Your head and your body, driven to their utmost, could not alone have stood the strain. It needed one thing more, and that you had—a vital sympathy with and generosity toward men—your own assistants and associates. This drew around you at Menlo Park a group of young men, voluntarily worshipping at your shrine, now known as Edison Pioneers, but who might be known as the apostles of the electrical industry—attracted and held by your enthusiasm, coupled with all the things which make one man serve another.
>
> "As you grew older and projected that vitality in other fields, great leaders and millions of men, women and children have been attracted by it. All seek to do you honor. The President of the United States is here. Millions of people, not alone in your own country but in others, celebrate with you tonight on the radio, and without your lamp as a forerunner the radio would have been impossible. Most conspicuous of the many is our host, Mr. Henry Ford. He has built the Edison Institute of Technology and Industrial Museum in your honor. Other men could have built an institute, but Mr. Ford has done something more."

In concluding his address Mr. Young read greetings and felicitations to Mr. Edison from the Prince of Wales, President von Hindenburg of Germany, as from one octogenarian to another, and from Commander Byrd in Little America in the Antarctic. Mr. Ford was then introduced and bowed his acknowledgments.

The final address was given by Herbert Hoover, President of the United States, from the brilliantly lighted balcony of the Menlo Park laboratory office. He spoke to two purposes, in appreciation of Thomas Edison's accomplishments in the service of civilization and humanity and in dedication of the Edison Institute of Technology.

Throughout the speaking the guests were conscious of the detonations of fireworks and the recurring drum ot airplanes participating in a great gala display of illumination outside Independence Hall, bearing testimony to the wonders of this gift of light for which the wizard of Menlo Park has placed the world in debt. The touching words of Mr. Young, the great tribute paid by the President of the United States, the presence of Madame Curie, come from France to add her reverent testimonial to the honor of this man of science were pallid beside the words of Mr. Edison himself. He arose trembling with emotion, and expressed his grateful appreciation in these simple words:

"I am told that tonight my voice will reach out to the four corners of the world. It is an unusual opportunity for me to express my deep appreciation and thanks to you all for the countless evidences of your good will. I thank you from the bottom of my heart.

"I would be embarrassed at the honors that are being heaped upon me on this unforgettable night were it not for the fact that in honoring me you are also honoring that vast army of thinkers and workers of the past, and those who are carrying on, without whom my work would have gone for nothing.

"If I have spurred men to greater efforts and if our work has widened the horizon of man's understanding even a little and given a measure of happiness in the world, I am content.

"This experience makes me realize as never before that Americans are sentimental, and this crowning event of Light's Golden Jubilee fills me with gratitude. I thank our President and you all.

"As to Henry Ford, words are inadequate to express my feelings. I can only say to you that, in the fullest and richest meaning of the term, he is my friend.

"Good night."

Crowd at Dearborn Waiting in the Rain to See the President and Mr. Edison

The President's Address at the Edison Celebration

By HERBERT HOOVER

President of the United States of America

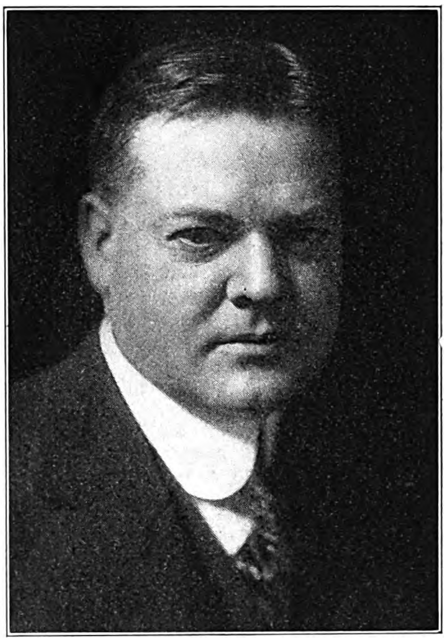
FELLOW COUNTRYMEN AND WOMEN:

This ceremony is a part of the celebration of Mr. Edison's invention of the electric lamp. It is also the dedication of the Edison Institute of Technology, the gift of Mr. Ford. Both are, in fact, national tributes to Mr. Edison.

The multiplication of the amount of light in the world a thousandfold is worthy of celebration, for darkness is a forbidden limitation upon righteous human activities.

When Mr. Edison invented the electric lamp he may perhaps have thought just to produce plain light and more of it at less cost. I surmise that his wildest ambition was to relieve the human race from the curse of always cleaning oil lamps, scrubbing up candle drips, and everlastingly carrying one or the other of them about. He may have thought to add safety to Chicago against a second accident from an oil lamp. But the electric lamp has found infinite variety of unexpected uses. It enables us to postpone our spectacles for a few years longer; it has made reading in bed infinitely more comfortable; by merely pushing a button we have introduced the element of surprise in dealing with burglars; the goblins that lived in dark corners and under the bed have now been driven to the outdoors; evil deeds which inhabit the dark have been driven back into the farthest retreats of the night; it enables the doctor to peer into the recesses of our insides; it substitutes for the hot-water bottle in aches and pains; it enables our cities and towns to clothe themselves in gayety by night, no matter how sad their appearance may be by day. And by all its multiple uses it has lengthened the hours of our active lives, decreased our fears, replaced the dark with good cheer, increased our safety, decreased our toil, and enabled us to read the type in the telephone book. It has become the friend of man and child.

In making this, as in his other great inventions, Mr. Edison gave an outstanding illustration of the value of the modern method and system of invention, by which highly equipped, definitely organized laboratory research transforms the raw material of scientific knowledge into new tools for the hand of man.



PRESIDENT HOOVER

In earlier times mechanical invention had been the infrequent and haphazard product of genius in the woodshed. But science had become too sophisticated a being to be wooed in such surroundings. Nowadays a thousand applied science laboratories, supported by industries of our country, yearly produce a host of new inventions.

I can perhaps illustrate this modern method of invention. The fundamental natural laws of electricity were discovered three-quarters of a century ago by Faraday, Hertz, Maxwell and other great investigators in the realms of pure physics and mathematics. Faraday discovered that energy could be transformed into electricity through induction —the theory of the electrical generator. It was one of the momentous discoveries of history. It is related that Mr. Gladstone was induced to visit Faraday's laboratory to see this new scientific contraption. When Gladstone is said to have made the characteristic practical man's inquiry, "Will this ever be of use to mankind?" Faraday replied, "Some day you will collect taxes from it."

Mr. Edison, using organized systematic laboratory research, has been one of the great leaders who have converted the pure physics of electricity into a taxable product. Today the Governments of the world levy upon upward of $60,000,000,000 of new wealth founded upon electricity.

But the taxes and new wealth are not the major accomplishments of the men of this genius. These are the rivers of sweat saved from the backs of men and the infinite drudgery relieved from the hands of women.

I may emphasize that both scientific discovery and its practical application are the products of long and arduous research. Discovery and invention do not spring full grown from the brains of men. The labor of a host of men, great laboratories, long, patient, scientific experiment, build up the structure of knowledge, not stone by stone, but particle by particle. This adding of fact to fact some day brings forth a revolutionary discovery, an illuminating hypothesis, a great generalization, or a practical invention.

Research both in pure science and in its application to the arts is one of the most potent impulses to progress. For it is organized research that gives daily improvement in machines and processes, in methods of agriculture, in the protection of health, and in understanding. From these we gain constantly in better standards of living, more stability of employment, lessened toil, lengthened human life, and decreased suffering. In the end our leisure expands, our interest in life enlarges, our vision stretches. There is more joy in life.

It is the increasing productivity of men's labor through the tools given us by science that shattered the gloomy prophecies of Malthus. More than a century ago that great student held that increasing population would outrun the food supply and starvation was to be the inevitable executioner of the overcrowded earth.

But since his day we have seen the paradox of the growth of population far beyond anything of which he ever dreamed, coupled at the same time with constantly increasing standards of living and ever increasing surplus of food. Malthus was right except for a new contestant in the race with his principle: that was more scientific research, more discovery. And that race is still on. If we would have our country improve its standards of living and at the same time accommodate itself to increasing population we must maintain on an even more liberal scale than ever before our great laboratories of both pure and applied science.

Our scientists and inventors are among our most priceless national possessions. There is no sum that the world could not afford to pay these men who have that originality of mind, that devotion and industry to carry scientific thought forward in steps and strides until it spreads to the comfort of every home; not by all the profits of all the banks in the world can we measure the contribution which these men make to our progress. And they are the least interested in the monetary results. Their satisfactions are in their accomplishment—in the contribution of some atom of knowledge which will become part of the great mechanism of progress. Their discoveries are not the material for headlines. Their names are usually known but to a few. But the Nation owes them a great honor and is proud to demonstrate through Mr. Edison today that their efforts are not unappreciated. The country can well pay its tribute to the men of this genius by expanding the facilities for their labors. The Nation today needs more support to research. It needs still more laboratories. To that Mr. Ford is making a generous contribution.

And in establishing this institute, Mr. Ford is doing honor to Mr. Edison in a manner which appeals to a sense of fitness—that is, by founding an institution dedicated to education and scientific research.

And scientific research means more than its practical results in increased living comfort. The future of our Nation is not merely a question of the development of our industries, of reducing the cost of living, of multiplying our harvests, or of larger leisure. We must constantly strengthen the fibre of national life by the inculcation of that veracity of thought which springs from the search for truth. From its pursuit we shall discover the unfolding of beauty, we shall stimulate the aspiration for knowledge, we shall ever widen human understanding.

Mr. Edison has given a long life to such service. Every American owes a debt to him. It is not alone a debt for great benefactions he has brought to mankind, but also a debt for the honor he has brought to our country. Mr. Edison by his own genius and effort rose from modest beginnings to membership among the leaders of men. His life gives renewed confidence that our institutions hold open the door of opportunity to all those who would enter.

Our civilization is much like a garden. It is to be appraised by the quality of its bloom. In degree as we fertilize its soil with liberty, as we maintain diligence in cultivation and guardianship against destructive forces, do we then produce those blossoms, the fragrance of whose lives stimulates renewed endeavor, gives to us the courage to renewed effort and confidence of the future.

Mr. Edison's Message to the World

Through the courtesy of the General Electric Company, a special short wave broadcast at 5 p.m. on Oct. 21 from Dearborn, Mich., carried Thomas A. Edison's message to the world. This necessitated a leased wire from the old laboratory at Dearborn direct to the short wave transmitters of the General Electric Company at Schenectady. The arrangement was made by Mr. Henry Ford and Mr. J. F. Quinlan, Executive Secretary of Light's Golden Jubilee.

Mr. Edison's message was read by Mr. E. Wilbur Rice, Jr., Honorary Chairman of the General Electric Company, as Mr. Edison was not in a position to read it in person. Mr. Rice was introduced by Mr. Quinlan. Mr. Edison's message was as follows:

THE contribution to the growth of the electric light and power industry has been truly international. We are celebrating today, the world over, fifty years of wonderful progress, including contributions from practically every country.

It gives me great satisfaction to extend, personally, greetings to my coworkers in every country of the Eastern Hemisphere on this occasion of Light's Golden Jubilee.

I wish that I could talk personally to Italy, France, Germany, England, Australia, and every other country but, as this is not possible, please accept these general remarks addressed to you all as my personal appreciation of your interest in this celebration and of the contributions made by you all to the raising of life's standards.

Now, to our neighbors in the great Latin American countries at the South, I wish to express my appreciation for your interest in Light's Golden Jubilee. We are growing closer and closer to each other as the years pass by and we all realize, I think, that electricity is playing an important part in this closer union of thoughts and ideals.

I wish it were possible for me to visit the many romantic places in your countries and to meet your distinguished citizens who have contributed so much culturally as well as industrially to the development of the Western Hemisphere and of the world. But at least I have the pleasure, and I am glad I have the privilege, to extend to you all, on the occasion of Light's Golden Jubilee, my heartiest greetings.

To my fellow-countryman, Commander Byrd, 'way down near the South Pole, and to the brave adventurers with him, I send my greetings. I know that the light of high purpose and brave resolve in the interest of scientific achievement has burned brightly for you through the long night; and I am glad that I have this opportunity of sending you my hearty wishes for a distinguished success.

Prof. Einstein's Message to Mr. Edison

New history was made on the night of the Edison celebration, Oct. 21, when Prof. Albert Einstein's tribute to Mr. Edison was broadcast from Berlin, Germany, across the Atlantic to Dearborn, Mich., and then rebroadcast throughout the country. This was the first occasion when all radio listeners in the United States could hear the voice of one speaking from so distant a place as Berlin. The transmission from Berlin was over the standard long-wave system of the American Telephone & Telegraph Company.

The message of Professor Einstein, translated into English, was as follows:

"MY Dear Mr. Edison: It affords me an unusual pleasure to be permitted to send you my greetings from this most distant point. The intellectual workers everywhere, especially physicists and technicians, today address their thoughts to you and your achievements in a spirit of admiration and devout sympathy.

"You have been equally successful as pioneer, as developer and as organizer. Your construction of the incandescent lamp has made possible the development of a mighty electrical industry.

"The technical geniuses of the world, of whom you are one of the most successful, have confronted mankind with a new situation in the course of the past half century—a situation to which it has not yet succeeded in adapting itself.

"Today man no longer requires the use of his muscles to obtain those commodities necessary for the maintenance of life. He no longer needs to function as a motor or a slave.

"The creative geniuses of coming generations in all probability will be the leaders of men whose duty it shall be to divert the resources of technique from the purposes of war into the service of economic welfare and the liberation of mankind."

An Outstanding Event in Radio History

By M. H. Aylesworth

President, National Broadcasting Company

FIVE hundred men and women sat in a banquet hall at Dearborn, Mich., last month and heard distinguished Americans pay tribute to Thomas Alva Edison.

A scant half dozen witnessed reenactment of the construction of the first incandescent electric light, in a little laboratory like the one in which Mr. Edison perfected that invention.

Fifty millions of persons in the United States, and unknown numbers in virtually every other country in the civilized world heard the voices of President Hoover, Owen D. Young, William S. Barstow and Mr. Edison himself, from the banquet hall. They also received a first hand description of the events in the laboratory from Graham McNamee, Phillips Carlin and William Lynch, National Broadcasting Company observers, and heard the voice of Albert Einstein, coming over the thousands of miles of space from Berlin.

Thus through the microphone, direct descendant of one of Mr. Edison's earlier inventions, were carried to the world the messages of tribute to the wizard of electricity.

The program comprised one of the outstanding events in radio history. In an event with so many important persons concerned, and with such a serious subject, it could well have been expected that the radio broadcast would be interesting, but not necessarily thrilling.

As a matter of fact, there was something deeply and touchingly human about the entire affair. The opening remarks of Mr. Young, in which he referred to the early days of Mr. Edison. while thoroughly dignified, instantly gladdened the heart of the radio listener, and made him feel the human-ness of the man Edison, dispelling the idea of the man-machine, grinding out mechanical contrivances in a mechanical way. Mr. Barstow, one of Edison's old associates, did much to carry on that atmosphere.

President Hoover's address was a masterpiece of understanding. His touches of swift-moving humor, his intimate treatment of his theme, served to emphasize the human side, not only of Mr. Edison, but of himself as well.

Mr. Edison himself, as he rose to reply to the tributes showered upon him, was visibly affected, and the emotion was apparent in the voice that went over the radio. On the verge of a collapse, his stout heart carried him on to the end of a day that had been filled with nervous and physical strain. It was an inspiring sight to those present to see the white haired veteran standing before the microphone, speaking to the world, but it is doubtful that they received a greater thrill than the millions of listeners who heard his voice in their own homes through the instrumentality of the radio.

The broadcast required a considerable amount of preparation by program directors and engineers. National Broadcasting Company workers spent months in cooperation with the Jubilee Committee, making detailed arrangements. We believe that the time and expenditure has been more than justified by the results, as manifested in messages of appreciation from listeners in all parts of the world.

Mr. Arkwright's Address at Port Huron

Among the thousands of Light's Golden Jubilee Addresses was one of particular interest made by P. S. Arkwright, past-President of the National Electric Light Association, at Port Huron, Mich., where Edison resided in the newsboy era of his career, and where also Mr. Arkwright first began his work in the electric light and power industry. Mr. Arkwright made the address at the unveiling of a boulder and plaque commemorative of Mr. Edison. He said in part:

INDIVIDUAL initiative, spurred by faith, imagination and persistency, brought success not only to Mr. Edison, but have proven the driving forces which have made the electric industry the great servant that it is to all mankind. Without that individual initiative; without that personal sacrifice and enterprise which goes hand in hand with private ownership, the electric industry would never have reached its great stage of usefulness.

We of the electric industry realize that although our achievements of the past have been great, the future holds even greater opportunities for us to serve. We fully sense our responsibilities—and if given the opportunity, we pledge ourselves to carry on for greater service to all the people the industry launched by the benefactor we honor here. The future holds greater home electrification—greater motorization of industry — better working conditions and a higher living standard for labor —greater and more electrification of the farm—and faster and safer transportation by electrification of the steam railroads and the development of night aviation.

Mr. Edison with his more than one thousand inventions has done much for humanity. His many inventions, commercially speaking, have gathered together capital totaling billions of dollars. But to me more important is, that his life has exemplified to the youth of the world what can be accomplished where there is a will to do—coupled with imagination, zeal and persistency. His works, his life, his living habits have proven an inspiration, have spurred on many to high and important endeavors, and have helped give to America the preeminent position that it holds in the world today.

No words that I can speak can better describe what I mean than those few words that came from Calvin Coolidge, when as President of the United States he pinned upon Mr. Edison's lapel the Congressional Medal of Honor:

"Noble, kindly servant of the United States, and benefactor of mankind, may you long be spared to continue your work and to inspire those who will carry forward your torch."

What Happened at Menlo Park, N. J., October 21, 1929

By FRANK A. WARDLAW

Secretary, Edison Pioneers

The "Eternal Light"

placed on concrete pedestal with bronze door on which is quotation from R. R. Bowker. It rests on actual center of site of original laboratory. The lamp in glass case is without filament and is illuminated by rays from lamps and reflectors within the hollow concrete base deflected through the eternal lamp neck. Electric lamps are supplied with current from Public Service lines and storage batteries.

THE day and evening were of ideal autumnal weather—not a drop of rain nor an unpleasant incident to mar the picture. Though but a few days had been at our disposal, the untiring efforts of H. A. Campbell, with the cordial cooperation of the Edison Lamp Works and the Public Service Gas & Electric Corporation of New Jersey, saw Menlo Park transformed from its usual lethargy into one of brilliance and animation.

Among the guests present at Menlo Park in the evening were Mr. Edison's children, Mrs. Marion Edison Oser, Thomas A. Edison, Jr., and William Leslie Edison, who remained throughout the entire celebration.

The presiding officer was W. S. Mallory; the speakers were former Governor George Silzer, former U. S. Senator Joseph Frelinghuysen and former U. S. Commissioner John A. Matthews.

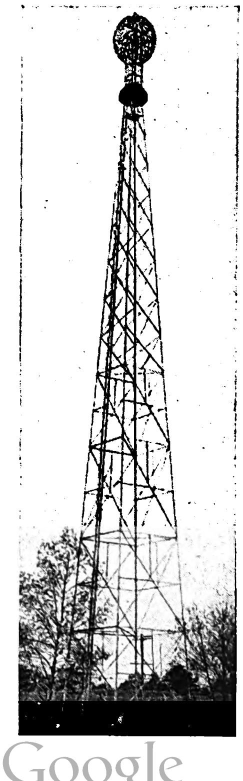
The band of the New York Edison Company had graciously tendered its services, and provided excellent music throughout the evening, a covered band stand having been built for its use. The band's services were secured through Mr. Campbell.

By seven-thirty in the evening, when the broadcasting commenced from Dearborn, an audience of some two or three thousand people had assembled in front of the speakers' stand, or remained in their cars. The broadcasting from Dearborn was exceptionally clear, a direct wire having been arranged for this purpose. At the conclusion of the Dearborn ceremonies, Mr. Mallory made a short but excellent address, reading among other things the telegram sent by John W. Lieb to the assembled pioneers, the three cheers and salute which he requested being enthusiastically given, U. S. Commissioner Matthews acting as cheer leader. It did one's heart good to hear the surrounding hills echo these cheers that for the time at least brought dear old Menlo Park to the "place in the sun" it once occupied. Former Governor Silzer was then introduced and, at the conclusion of his well-chosen remarks, was followed by former Senator Frelinghuysen, and he in turn by Commissioner Matthews, all of whom gave excellent addresses. Mr. Mallory then read a splendidly worded poem written by R. R. Bowker, and regretted Mr. Bowker's inability to be present, owing to Mrs. Bowker's indisposition.

Prior to the Menlo Park ceremonies, a telegram expressing the congratulations and affection of the Edison Pioneers assembled at Menlo Park was sent to Mr. Edison at Dearborn. The celebration closed at ten o'clock.

Many Edison Pioneers were present, all classes of membership being represented. Among these loyal adherents of Menlo Park was Edward Dean Adams, Messrs. Benton, Kreusi, Nesmith, Rowland, Estabrook, Melick, Campbell, Westerdahl, Bogart, Moore, Miller, Hickman, Mallory, McLean, Simmen, Baker, Dempster, Stebbins,

(*Continued on page* 756)



Group Taken at Menlo Park, N. J., Celebration

Included in the group are Mrs. Thomas A. Edison, Jr., Thomas A. Edison, Jr., Mrs. Marion Edison Oser, William L. Edison, Mrs. William L. Edison, C. E. Estabrook, Walter Kruesi, Edward Deane Adams and F. A. Wardlaw.
At right is the steel tower, 120 feet high surmounted by huge lamp (with base 15 feet high) made of steel frame work and carrying about 960 incandescent lamps, under which is the "Eternal Light," first lighted the evening of October 21 by Mr. Edison. The tower is lighted every night from dark to dawn and may be seen for miles.

Trip to Europe Offered as Prize in Employees' Speaking Contest

A TOUR of Europe during the summer of 1930, with all expenses paid, a second prize of $500 in cash and a third prize of $250 are the awards offered to the winners of the National Employees' Speaking Contest, initiated by the Public Speaking Committee of the Public Relations Section, N.E.L.A., and sponsored by the Association.

Thousands of employees representing practically all of the Class A member companies of the N.E.L.A. are expected to take part in the contest which will be conducted progressively. The preliminary elimination contests will be held first within member companies; second, between member companies within the State; third, between States within the Geographic Divisions, and finally between the Geographic Division winners. The winners of the National Contest will be announced at the 53rd Convention of the Association at San Francisco in June of next year.

The object of the contest is to increase interest in, and to promote a better understanding of the importance, benefits and practicability of public speaking activities throughout the industry.

The rules of the contest have been published in a booklet by the Association, copies of which may be secured free upon request to the National Electric Light Association, 420 Lexington Avenue, New York.

Any employee of a Class "A" member company of the N.E.L.A., except officers, managers and general office department heads, is eligible to talk on the selected subject, "The Electric Utilities' Contribution to My Community, State and Nation." The terms "officers," "managers," and "general office department heads" are subject to varying interpretations. There is no thought in the minds of the National Committee of excluding the small-town managers or superintendents. The contest is intended to attract the rank and file of the electric light and power industry rather than the managerial group. Subject to the foregoing, the question of eligibility will be in the hands of each State Committee, whose judgment shall be final.

The delivery of this talk must not consume less than 10 or more than 15 minutes. The treatment of the subject should combine historical background with application of conditions today; that is, what were the conditions prior to the advent of the use of electricity and what are they today; what has been the social and economic effect of electric utility development on individuals, home, place and business, and industry. Much available information can be secured through study of "Electric Light and Power Industry in the United States," files of the N.E.L.A. BULLETIN, *Electrical World, Electric Light and Power, Public Service Magazine, Forbes Magazine,* Geographic Division and member company publications, and many other sources.

Contests will be conducted progressively.

1. Within the member companies.
2. Member companies within the State.
3. States within the Geographic Division.
4. And final, between the Geographic Divisions.

Procedure

Member Companies

In conformity with the specified rules and regulations, it is recommended that each Class "A" member company of the N.E.L.A. arrange to have an elimination contest.

States

The winners for each Class "A" member company within a State shall compete in the elimination contest for the State at such time and place as may be designated by the State Committee.

Geographic Divisions

The winners for each State within the Geographic Division shall compete in the elimination contest for the Geographic Division at such time and place as may be designated by the Geographic Division Committee.

Final Contest

The winner for each of the Geographic Divisions shall compete in the Final Contest at such time and place as may be designated by the National Committee.

It is recommended that the chief executive of each Class "A" member company appoint a committee of three to sponsor and make all necessary arrangements for the contest.

In States where there exists an association representing the interests of the electric light and power industry, it is recommended that the executive officer of such association appoint a committee of three to plan for the State, the executive officer of such State association to be a member of this committee. In States where no association representing the interests of the electric light and power industry exists, the secretary of the Geographic Division in which the State is located will make arrangements for appointment of a State committee.

It is recommended that the president of each N.E.L.A. Geographic Division appoint a committee of three to make all arrangements for the elimination contest within that division, the secretary of the Geographic Division to be a member of this committee.

The National Committee has been appointed and will make all arrangements for the completion of the contest and see that winners receive their prizes.

The first prize in the National Contest will be a tour of Europe during the summer of 1930, with all expenses, exclusive of purely personal items, paid from the winner's residence to port of embarkation to Europe and return to home city. The trip to be made in company and under the guidance of some reputable tour company, with the purpose in mind of having the winner not only see the various points of interest, but to learn something of value relative to the electric light and power industry in Europe. This would call for visiting one or more of the principal power companies, where arrangements will have been made for visits to power plants, offices, etc.

The winner will be required to obtain his or her own passport and to send it to the National Electric Light Association. All details of the tour (including visas of passports) will be taken care of at no expense to the winner.

The second prize will be $500.

The third prize will be $250.

Each company, each State and each Geographic Division is responsible for all expense for judges, for prizes and for traveling within the company, the State or the Geographic Division, respectively.

The order in which contestants shall deliver their address will be determined by drawing for position immediately before contest.

All addresses shall be judged equally on composition and delivery. In judging composition, the judges will consider grasp of the subject, arrangement of material, and the constructive character of ideas. In delivery, the judges will consider clarity, force of expression and general platform decorum.

Be Damned if You Do and Be Damned if You Don't

By AMPLIFIER

IT so happened that in the days of ancient Greece a young Athenian desired to become a lawyer. Going to a teacher of the law he said: "Teach me the law and after I have become proficient and have won my first case in the courts I will pay you twenty-five hundred drachmas."

To this the teacher agreed, but after his studies were completed the young man's interest in the law waned and he concluded that he did not wish to become a lawyer. The teacher sued him for breach of contract and demanded judgment in the sum of twenty-five hundred drachmas. The young student elected to defend himself in the courts, his defense being that he had agreed to pay the twenty-five hundred drachmas only after he had won a case before the courts.

He thereupon found himself in this predicament: If he defended himself successfully, he would have won his first case, and the twenty-five hundred drachmas would be immediately due under the law. If he lost the case, the courts would give his teacher judgment in the sum of twenty-five hundred drachmas. Either way he must lose.

The moral of this story might very easily be that a man who is his own lawyer has a fool for a client. That, however, is not the point I wish to make. The young man's situation was analogous to the situation in which many great public services, and, in fact, a great many other national industries, find themselves today: no matter what they may elect to do, it is a case of "be damned if you do and be damned if you don't."

THE most outstanding example of situations of this kind has to do with the whole question of publicity, which those who insist that our whole economic system of production and distribution is all wrong persist in calling "propaganda," emphasizing the word in such a way as to insinuate that it is some sort of criminal practice.

The dictionary tells us that propaganda is "an effort directed systematically toward the gaining of public support for an opinion or a course of action." If this is a correct definition, and I believe it is, then every candidate for office who endeavors to gain public support of his candidacy, every public official seeking indorsement of his policies and actions, every editorial writer, every public speaker, every manufacturer or business man seeking public favor for his wares, is a propagandist. Every chamber of commerce, citizens' association, parent-teachers' organization, farm or industrial organization, labor union, pacifist or national defense advocate, minister or social worker, college professor or public school teacher, indulges systematically in propaganda. To insist that the word is in disrepute is to insist that many of the acts of a majority of our most intelligent citizens are disreputable.

IN the old days, the critics of large business enterprises based their most severe criticisms on the alleged secrecy with which the executives of these enterprises surrounded their operations. They claimed that the public had a right to know what they were doing, how they were financing themselves, what profits they were making, and so on and so forth. The result was legislation that makes it possible for any citizen who may be interested to find out almost as much about any business as the president or chairman of the board of directors of that business. Some of this legislation was good and has worked in the interests of the public; some of it was bad and has worked against the interests of both the public and industry.

Then American business decided on a new course of action. It decided that instead of trying its case before legislative committees engaged in considering proposed laws which affected it, it would try its case in the court of public opinion, acting as its own lawyer, or engaging public relations or publicity experts to act for it. This policy was soon generally adopted, and today practically every industry of size in the country has its publicity department. The balance sheets, statements of profit and loss, accomplishments and financial problems are all placed in evidence before the High Court of American Public Opinion.

This policy, however, has been upsetting to the socialistically inclined, who almost invariably demand *ex parte* hearings, whether before Congressional Committees or the public at large. They do not believe in courts, where defense is possible. They desire to be judge, jury, prosecuting witness and executioner, and, just as they once damned business for alleged secrecy, they now damn it for its policy of disseminating information concerning itself, and seek judgment against it from the public.

No industry has been subject to greater criticism of this kind than the light and power industry. Some years ago it embarked on a policy of telling the public everything there was to know about its business, circumstances at that time making such action almost imperative.

In 1919, the public utility industry of the country generally was in great difficulties. Labor, material and other operating costs had been doubled and trebled. Rates remained stationary at, or near, pre-war levels; increases were difficult to secure from regulating authorities. Earnings were, in consequence, adversely affected; often disastrously. Utility development was all but stopped. The war had interrupted plant and equipment construction, and this deficiency, plus the additional plant and equipment needed for new service demands, could not be supplied without new capital. The new capital could be obtained on suitable terms only in competition with other industrial borrowers, by restoring credit, and rewinning investor confidence on a basis of fair rate readjustments.

MOST companies in all branches of the utility industry—gas, electric, telephone, electric railways, etc.—were crippled. Some were being strangled. By March 15, 1919, upwards of 70 street railway systems were in receiverships and many others were near it. The street railway situation reacted upon all other utilities, correspondingly increasing their difficulties, and the general utility situation was, consequently, disturbing the entire financial and economic structure of the country.

In order to understand the gravity of the situation it is necessary to go back about a year. On February 15, 1918, the Secretary of the Treasury wrote the President as follows:

"Dear Mr. President: I beg to hand you herewith several memoranda and letters relating to street railway and other local public utilities furnishing light, heat and power, which I have been asked to bring to your attention by a committee representing public utility interests.

"These papers indicate the existence of genuine apprehension regarding the adequacy, under present conditions, of the services and rates of local public utilities. The view is expressed that increased wages and the high cost of essential materials and supplies have affected them as they have affected everybody else, and that united effort will be necessary in order to meet alike the public requirements for service and the corporate financial needs upon which that service depends. . . .

"Our public service utilities are closely connected with and are an essential part of our preparations for and successful prosecution of the war, and the unfavorable tendencies which the accompanying papers reveal may most effectively be checked, wherever they may be found to exist, and the needed relief obtained, only by prompt action on the part of the respective local authorities. . . . "

To which President Wilson replied on February 19, 1918, as follows: "I have examined with care the memoranda and letters which you transmitted to me with your letter of the fifteenth. I fully share the views you express regarding the importance of the public service utilities as a part of our national equipment, especially in war time. It is essential that these utilities should be maintained at their maximum efficiency and that everything reasonably possible should be done with that end in view. I hope that State and local authorities, where they have not already done so, will, when the facts are properly laid before them, respond promptly to the necessities of the situation.

"I shall be glad to have you communicate with the local authorities whenever the information in your possession suggests that such a course is desirable and in the national interests."

BY May, 1919, the situation had become so serious that the cabinet took the matter up and decided to communicate with the President, who was in Paris attending the Peace Conference. On May 15, Secretary of Commerce Redfield and Secretary of Labor Wilson addressed a joint letter to President Wilson in which it was stated that the electric railway problem had "recently assumed such serious national proportions as to warrant the prompt attention of the Federal Government," and recommending the appointment of a Federal board or commission, "whose duty it shall be to study and report upon the entire problem. . . . "

In response to this letter the President cabled his approval of the plan, and on June 1, 1919, the commission was created by him and went to work.

During the next two or three years necessary utility rate increases were allowed by regulatory authorities, credit was restored, expansion programs carried out—and then, in most instances, rates were returned to their previous level, and even to lower levels.

At the same time the electric utility industry, which was being seriously affected by the whole financial and economic situation, went about the immediate adoption of a policy of open publicity with the same systematic thoroughness which has characterized the conduct of its business almost since the days when Edison placed into operation the first central lighting station in Pearl Street, New York. Cooperating with the gas, street railway and telephone companies, it organized public utility information bureaus covering 38 of the states, and set about to furnish newspapers, periodicals, writers, public speakers, educators and the public generally with facts regarding the industry. There never was any secret about the source of the news supplied. There were few, if any, pieces of publicity which did not bear the imprint of some public utility information bureau, or some public utility company or some State or national organization of public utilities. In fact, any other procedure would have been foolish, because anonymity is anathema to the average American, and particularly to American editors of standing.

WHAT happened? All of the advocates of public ownership and operation of public services from parlor pinks to communist reds set up a wail sounding like a lost soul with its tail caught in the red-hot door of Tophet, claiming that all of this publicity was devised solely in the interests of private ownership and operation and in opposition to all forms of municipal, State or Federal ownership. This, of course, is remote from the truth, as any survey of the material sent out over a period of years will demonstrate; but, for the sake of argument, suppose that it had been partially true. What of it?

Why should not the owners and operators of the light and power industry defend their property rights in the courts of public opinion, just as the owners of any other business enterprise would defend their property rights against confiscation by the government, and seek to prove, if it can be proved, that government ownership and operation is not in the public interest? What would our agricultural organizations have to say if the government should take the position that a nation's food supply is of paramount importance to the people and attempt to seize all the farms in the United States, leaving our farmers no choice but to work for the government or seek other lines of occupation? The same question might be asked with regard to almost any industry, but the answer can easily be found in present-day conditions of industry and labor in Soviet Russia.

For years the industry was severely criticized for not extending its lines into rural areas and to small communities with greater rapidity. Financial obstacles, lack of interest on the part of the farmer, or the small community, making it difficult to secure a sufficient market for light and power to pay operating expenses, much less interest on the required investment, and physical and political difficulties were all brushed aside by the critics as matters of no moment.

WITHIN the past few years literally thousands of small communities have received electric service for the first time. This has been made possible by interconnection and consolidations of properties. Approximately 500,000 farms have been electrified. Yet the advocates of government ownership and operation refuse to recognize these developments as being to the credit of the industry, implying, in their criticisms, that it has simply widened its field for exploitation. They would have us believe that it is the better part of wisdom to have the government carry on these developments, charging at least a part of the cost to the taxpayers, rather than to require from those who obtain the benefits of the service the payment of a rate which will carry the investment and the operating expenses.

When the scheme of regulating public utilities as to rates and quality of service was first broached, the light and power companies looked at it askance in much the same way that the insurance companies looked upon the project of compulsory workmen's compensation insurance, or the railroads upon control and regulation by the Interstate Commerce Commission. For this attitude they were severely condemned by their critics. Now that the scheme of control and regulation by means of State utility laws administered by State commissions seem to be working out to the benefit of investors, consumers and the general public alike, and now that the public utilities are strongly in favor of it, the government ownership and operation folks claim that there must be something wrong with it and that some new, strange and untried scheme should be substituted for it. Their position seems to be that because the utilities no longer oppose it, commission regulation is a failure.

We are told frequently and emphatically that the utilities spend untold sums in the purchase of advertising space and that they do this solely for the purpose of influencing editorial opinion. Nothing is said about the fact that the utility business is just like any other business and must sell its product by similar methods. Nor is any mention made of the fact that a considerable portion of this advertising is for the

James E. Davidson Prize Paper

A Study of Merchandise Advertising

By KEO CURRIE and RAY WARREN

MISS CURRIE

This paper won the James E. Davidson first prize Award for 1928-1929. The authors are both employed in the Advertising Department of the Public Service Company of Northern Illinois.

*Miss Currie * became the company's advertising copy writer in May, 1925. Previously she was an editorial writer with a retail research organization in Chicago and with an advertising firm in Washington, D. C. She grew up in western Nebraska, attending the state university.*

Mr. Warren is chief clerk of the Advertising and Publicity Department and secretary of the Advertising Committee of the Public Service Company. He has spent seventeen years in the utility business in a variety of capacities. For three years Mr. Warren was on the National N. E. L. A. Customer Relations Committee and for three years, was a member of the Great Lakes Division of the Customer Relations Committee, serving one year as chairman. Mr. Warren received his school training at Lewis Institute, Chicago.

*Miss Currie has recently joined the staff of the Arnold Research Service, with headquarters in New York.

MR. WARREN

PART 1.

A METHOD OF BUILDING AN ITEMIZED BUDGET FOR APPLIANCE ADVERTISING

Based Upon Sales Volume and the Electric Load Revenue Derived from the Appliances Sold

AN investigation which was commenced a couple of years ago as an attempt to find a way to make retail electric appliance advertising more helpful in stimulating sales, led to definite ideas for a better control over the disbursement of the advertising appropriation and to a method for the solution of a public utility accounting problem of long standing. It is because it is believed that these ideas may prove of value to any public utility company engaged in the retail selling of home appliances that this account of the investigation has been prepared by those who initiated and carried out the study.

The study was made by means of figures on the advertising costs and the sales volume of a certain group of stores for the year 1927. The essential plan of procedure was to consider each kind of appliance a unit as to its advertising and as to its sales. The advertising given each appliance during the year 1927 was computed in dollars, based upon the amount of space given the appliance, either in newspapers or in some form of direct mail advertising. Some difficulty was encountered in obtaining sales volume figures to match against the advertising costs, as it was found that the cost of obtaining such data by separate appliances would be prohibitive. However, accurate figures were available as to the number of each appliance sold during 1927. Therefore, the sales volume for the year for each appliance was estimated as carefully as was possible, by establishing an average selling price for each appliance and multiplying this by the number sold during the year.

The study then proceeded, with two definite theories to be investigated: first, that each appliance should receive advertising in direct proportion to the sales volume it earns; second, that there must be some logical way by which the electric load added to a company's lines by the sale of electric appliances, may be made a definite factor in determining the advertising appropriation. The second of these two theories, the load revenue factor, will be discussed fully later on in this report.

Each Appliance Earns Its Own Advertising

It is a generally accepted practice in many lines of business to estimate total advertising expenditure upon a basis of sales. For the year 1927, for the retail stores whose figures were taken for the study, total merchandise advertising costs amounted to approximately 8 per cent of the sales volume of the year. Upon the theory that each appliance should receive advertising in direct proportion to its sales, the first step was to use the data at hand to see if each of the appliances had received approximately 8 per cent of its individual sales in advertising.

Since the purpose of this paper is to explain the methods developed by the investigation, rather than to present the complete budget, the figures on certain appliances will be used to aid in the explanation, but no attempt will be made to give detailed studies on all appliances. Thirty appliances, including all the important ones sold in 1927 by these stores, except portable lamps, were studied. Twenty were electric appliances, ten were gas appliances. Table I, shown above, compares the sales volume and the advertising costs upon two items; electric ranges and kitchen lighting units.

	Average Selling Price	Number Sold in Year	Estimated Sales for Year	Actual Advertising Cost	% of Advertising to Sales
Electric Ranges...........	$135	525	$70,875	$2,105	3%
Kitchen Lighting Units....	$4	3,335	$13,340	$13,579	101%

Table I

Table I makes clear that not all appliances had been receiving support in proportion to individual sales returns. One item, kitchen lighting units, had more money spent on it for advertising alone, irrespective of other selling expenses, than was received in the total sales of the appliance. In contrast to this item on which the advertising cost was 101 per cent of sales for the year, is another appliance on which the advertising amounted to only 3 per cent of sales. No reasonable excuse can be given for the difference in the treatment accorded the two items, except that the condition was not realized because no comparisons had been attempted on the basis of individual advertising and sales figures. This is admittedly a somewhat extreme instance of contrast. Whereas on total annual merchandise sales, the advertising was 8 per cent, here we have one item on which 101 per cent was spent and another on which only 3 per cent was spent. In many of the thirty appliances studied, the amount spent for advertising was fairly close to the 8 per cent established by the total figures.

TABLE II—Preliminary Budget Based on Sales

	Estimated Annual Sales	Percent for Advertising	Preliminary Budget	Increase Over 1927 Advertising	Decrease From 1927 Advertising
Electric Ranges...........	$70,875	8	$5,670	$3,565	
Kitchen Lighting Units...	$13,340	8	$1,067		$12,508

Table II

An Itemized Budget Based Upon Itemized Sales

In the table of figures (Table II) shown above, each appliance is allotted the amount of advertising which it would have received, at 8 per cent of its individual sales. For the sake of convenience in referring to it, this allotment to each appliance is called the Preliminary Budget Based on Sales. It is the first step in preparing the budget.

While it is not claimed that past sales can give exact dimensions for future advertising expenses, they are believed to be the starting point for determining the sound plan of expenditure. In planning to do a certain volume of sales in an ensuing year, it is wise to start from the facts shown as to past sales. The same applies to planning advertising and to budgeting its future expenses. This Preliminary Budget Based on Sales is later to be carefully analyzed at which time special consideration will be given to expected sales increases and various other influences. In that analysis, each appliance will be considered upon its own facts.

In the Preliminary Budget, a sum is set aside for advertising which is 8 per cent of the 1927 sales volume. Many will consider this too high a percentage to use. Any desired percentage could be used. However, to use a rather high percentage on past sales is equivalent to using a smaller percentage on the increased sales planned for during the year to come, and with that in mind the 8 per cent may not be excessive. In this particular study, the use of this percentage has advantages for the sake of comparisons, since it maintains the percentage already stated as existing between total actual merchandise sales, and total actual merchandise advertising costs for the year studied.

"Pioneer" Advertising

As shown by Table II, the Preliminary Budget Based on Sales, advises a sharp decrease in the amount of advertising to be given to kitchen units and an increase in the amount of advertising to be given to electric ranges. It will be interesting to look into the reasons why the kitchen unit advertising of 1927 was so extensive. Kitchen units were comparatively new in the territory served by these electric appliance stores. A campaign the previous year had resulted in the sale of a large number of kitchen lighting units. By 1927, however, a change in marketing conditions had taken place. Previous to the first year's campaign, wiring contractors paid little attention to the lighting of kitchens. It was sufficiently difficult to interest their customers in the installation of adequate lighting fixtures for the so-called important rooms of the home. In the kitchen, a simple drop cord with lamp often unshaded, was considered suitable. Apparently as a result of the extensive campaigning by the utility company, it became true that practically every wiring contractor includes a kitchen unit in his bid, that practically every architect includes one in his estimate, and that most home builders insist upon having the kitchen adequately lighted. Where one company had been handling the lighting unit business through its retail stores, there came to be about as many agencies for selling such units as there were electrical dealers and contractors in the district served.

Was the $13,579 worth of advertising by the utility company wasted? Certainly not all of it was wasted. Every lighting unit sold, whether by the company or by an outside agency, meant more business for the lines of the electric company.

A Budget for Pioneer Advertising

This raises the question as to the responsibility for advertising which increases the electric load revenue, and which is referred to as Pioneer Advertising. How far should a utility company go in pioneering an appliance not well known to the public, but which will increase its business as a firm supplying electricity—which is, of course, the business for which the company exists. In preparing a budget for the advertising of an appliance of the pioneer type, how can any estimate be made as to the amount of money to be set aside for such advertising? How, especially, can this be done at the very first when no sales record exists, or when sales have been so unimportant in volume that the usual percentage would not yield a large enough sum to purchase useful advertising?

The further question is raised as to the responsibility of the retail merchandise sales department in paying for such advertising. Is it fair to charge merchandise sales with an excessive advertising cost, on the theory that the electric company as a whole benefits from the increased load revenue derived from the use of the appliances? This question, which is chiefly an accounting problem, has been met in the past by creating promotional or new business accounts, separate from the merchandise advertising accounts, and charging to them all advertising costs on such appliances as were recognized as deserving or needing support as builders of load revenue. But how could such appliances be recognized, except upon a somewhat guesswork basis of personal opinion. We have already had one example of how the guess-work basis worked out in dividing advertising money to apportion it to kitchen units and ranges. Would it have been possible to guess in advance as to which of these two appliances should have had its advertising charged to a new business account?

Electric ranges, as a matter of fact, have been looked upon as deserving promotional support and the advertising of electric ranges has been charged to new business. This was undoubtedly justifiable in the early stages of selling electric ranges. However, as shown by Table II, by the time that annual sales consist of 525 ranges, a considerable sum is available for advertising, on a straight sales-budget basis. In other words, ranges have become at least partly self-supporting.

The kitchen unit, as a matter of fact, was not judged to be deserving of promotional support, possibly because it was considered a more easily salable item, and its advertising was charged to merchandise sales, even though the advertising cost was 101 per cent of sales. If it paid the utility company to spend this amount of advertising, due to increased return in load revenue on lighting bills, then surely, a part of the expense was a legitimate charge on the promotional or new business account. But how decide what part?

An Itemized Budget Based Upon Load Revenue

The purpose of the study, with regard to pioneering appliances, became one of finding a way to determine which portion of the advertising expense should be charged to sales and which portion should be charged to new business. Most of all, it was desired that a plan be devised for making the division upon some logical basis, eliminating guess-work as far as possible.

Since the idea back of permitting pioneer advertising to be done on certain appliances, is that they are good load-builders, the plan was hit upon of basing a secondary budget upon the estimated load revenue of each appliance (not of certain hand-picked appliances, but of all appliances) in exactly the same way that the Preliminary Budget Based on Sales was developed from the sales volume produced by each appliance.

To estimate the load revenue derived from each appliance sold, recourse was had to N. E. L. A. surveys and reports on this subject. In the case of such appliances as were not included in the N. E. L. A. reports, estimates were made carefully on local data and opinion. Table Number III presents the estimated load revenue of two appliances:

	Estimated Annual Load Rev.	Number Sold in Year	Estimated Load in Year	Actual Advertising Cost	% of Adv. Cost to Load Rev.
Electric Ranges...........	$55	525	$28,875	$2,105	7%
Kitchen Lighting Units....	$6	3,335	$20,010	$13,579	68%

Table III

The above table, worked out in the same manner as Table I, shows the estimated load revenue derived in one year from the use of the appliances sold during 1927, and compares to that revenue the actual advertising cost for the year. Thus, had the advertising expense been figured against estimated load revenue and not against sales volume, electric range advertising amounted to 7 per cent of load revenue, while the kitchen unit advertising amounted to 68 per cent of a year's load revenue.

Table No. IV presents the Preliminary Budget Based on Load Revenue. Here again, many will object to the use of so high a percentage as 8 per cent. There is a certain comparative value in retaining the same percentage used for the Preliminary Budget Based Upon Sales. As a matter of continued practice, distinct from the purpose of this paper to explain the study made, any budget based upon load revenue must take into consideration the life of the appliance. Various N. E. L. A. surveys have indicated that the average life of an appliance is from five to ten years. Calling it only five years, and using as the budget percentage only 2 per cent, would be the equivalent of taking 10 per cent of one year's load revenue. In view of this, the 8 per cent used seems sufficiently conservative. The next table, No. V, adds together the preliminary budgets based upon sales and based upon load revenue.

TABLE IV—Preliminary Budget Based on Load Revenue

	Estimated Total Load Rev. 1 Yr.	Percent for Advertising	Preliminary Budget	Increase Over 1927 Advertising	Decrease From 1927 Advertising
Electric Ranges...........	$28,875	8	$2,310	$205	
Kitchen Lighting Units....	$20,010	8	$1,600		$11,979

Table IV

TABLE V—Preliminary Total Budget

Electric Ranges		Kitchen Lighting Units	
8% of sales.................	$5,670	8% of sales................	$1,067
8% of load revenue.........	2,310	8% of load revenue.........	1,600
	$7,980		$2,667
Increase over actual 1927 expenditure................	$5,875	Decrease from amount actually spent, 1927.........	$10,912

Table V

It might be feared here that to arrive at the budget by assessing a sum based on sales and adding to that a sum assessed upon load revenue, would be to arrive at a total budget far in excess of a reasonable figure. Thirty appliances were studied. As in the two cases above, where the budget indicated an increase over the 1927 expenditure for one appliance and a decided decrease from the 1927 actual expenditures for the other appliance, various similar adjustments were indicated for other appliances, and the total for the thirty appliances was found to be very well in line with the total budget as arrived at by ordinary methods. When the total budget indicated by this method was compared to the quotas set for a new year, the budget was approximately 5 per cent of expected sales.

The budget, by this method, allots to each appliance an amount of advertising in direct proportion to what the appliance earns by its sales and by the load revenue it adds to the company lines. It is undeniably true that when an appliance is sold, no one can know that it will be in use in the town where it is sold or for the expected number of hours per year. However, because of the acceptance generally given to the N. E. L. A. averages, this point will not be argued here. It is believed that the budgeting plan here offered comes nearer a fact basis than any previous suggestion put forward as to how to draw the line between advertising expenses chargeable to merchandise sales, and those chargeable to a new business or promotional account. By applying this plan of budget-building, it is possible to charge the merchandise sales with that proportion of the budget which is based upon sales, and to charge the promotional account with that proportion of the budget which is based upon load revenue. This applies to every appliance. There is no need to guess as to which appliance deserves promotional support, and which does not.

Appliances Without Sales Records

Certain appliances are so new as to have no sales records, but each year when a new budget is prepared, the sales that have developed will automatically indicate a sales budget for the coming year. A few years ago, refrigerators had no sales record but they had to be advertised. The advertising was based upon an estimate of expected sales. Today, a large volume is done in this appliance. It ranked first of all electric appliances in this study of 1927 figures, in its dollar volume of sales. Part of its advertising expense became a legitimate charge upon merchandise sales. Under the old plan, all refrigerator advertising was charged to new business.

At present, electric dishwashers, electric exercisers and ultra-violet ray lamps have in many localities no sales records and their advertising must be based upon expected sales. As soon as they develop sales records, they will be earning their own advertising, based on sales, and based on load revenue.

It should be pointed out here that the electric manufacturer should furnish more than ordinary advertising aid when his appliance is new. Moreover, it might be well to consider asking the manufacturer to supply a greater share of the advertising when his appliance, new or old, is one which brings the electric company small load revenue compared to the sales it brings. An excellent example is the washing machine. It ranked fourth among the electric appliances as a sales producer, but was fifteenth in annual load revenue derived from the number sold. The load revenue of one machine in a year is estimated at only $2.50. The average selling price during the year on which the study was made, was $133. At this selling price, with machines of different types on display in the stores, it meant that a considerable sum of money was tied up in display and reserve stock. The utility company, thinking of it now in its primary business of supplying electricity, benefited very little in increase of load revenue, as a result of the large investment which it carried in washing machines for sale. If the company must make a $133 sale of another manufacturer's product, in order to increase by $2.50 the sale of its own product (electricity), then it should expect generous advertising assistance from the washing machine manufacturer.

All promising new appliances must be provided for in the budget, and probably no better plan offers, than to base the amount upon expected sales. This is guess-work, but only for the first year or two. The sums for these appliances are added to the total budget. On the other hand, some of the old established appliances will be found to earn greater budgets, both from sales and load revenue, than are needed for their advertising. Common sense will indicate some readjustments of the amounts put into the budget by the purely mechanical process of applying a given percentage. The analysis of the advertising needs of each appliance, in the light of expected sales, marketing conditions, etc., is an essential step in fixing the final budget.

Adjustment of Preliminary Budget

The electric iron's preliminary budget was $13,015. After due analysis, this was cut to $5,000, to be charged 70 per cent to a merchandise account, and 30 per cent to new business. This appliance, by the way, earned a greater load revenue than any other electric appliance studied, and was second only to refrigerators in annual sales. It may not be wise to take too seriously the theory that this item is near the saturation point. Whether or not it may be believed that 90 per cent of the families already own electric irons, it should not be overlooked that there is a large replacement business—and the iron sold for replacement is a better load-builder than the old iron, standing unused on a shelf. It is legitimate to charge a replacement sale's advertising cost partly to new business and partly to sales.

In the analysis of the Preliminary Budget for electric ranges, the sum indicated was not believed to be adequate. A consideration of marketing conditions locally, and a belief that this appliance had previously been under-advertised, led to the setting of a quota for greatly increased sales volume. Therefore, arbitrarily, if you like, but still for definite reasons, the final budget for the advertising of electric ranges was fixed at $15,000.

The Preliminary Budget for kitchen units, representing a decided decrease from the amount actually spent in 1927, was endorsed as sufficient. The reasons for this have already been referred to in this report.

Each of the thirty appliances was analyzed as to marketing conditions and special possibilities for future sales, and the amount of the Preliminary Budget was adjusted wherever sound reasons appeared to exist in favor of either an increase or a decrease in the advertising budget.

The fundamental principle of the budgeting plan is to consider each appliance separately. The application of the same percentage (8 per cent in this particular study) to all appliances as a preliminary step, is valuable in pointing out discrepancies in past practice. Deviations from this average will be found necessary, but in each instance will be made for definite reasons.

Actual Application of the Study's Results

The ideas developed in this study were submitted to the utility company's advertising executive committee late in 1928, and were endorsed subject to their being proved workable in actual use. The Final Budget on most of the appliances was not fixed until after this endorsement had been given to the ideas presented. It was considered important that such final budgets be determined by analyses made jointly by representatives of merchandise sales and advertising departments.

Because it was late in 1928 before the study was completed and endorsed, and because it was desired that it be put into immediate use without waiting for the completion of 1928 activities and compilation of new data based thereon, it was decided to use the data already gathered on the basis of 1927 advertising and sales figures, as a basis for the 1929 budget. Naturally, 1929 sales quotas would be much larger than 1927 sales, and in the analysis of the Preliminary Budget to fix upon the final budget for 1929, special care was taken to make ample allowance.

Among the difficulties, of which many are certain to be encountered when theories are reduced to practice, was the problem of exactly how to keep advertising cost records and report them to the accounting department in such manner that incoming bills for advertising, could be allocated to sales and new business accounts, in correct proportion to the sales volume and load revenue of each appliance. It was decided that the advertising department, in okaying each bill for payment, should endorse thereon the portion to be charged to each account.

An accurate but somewhat involved routine was arranged for supplying the information needed for making the division between accounts. Usually a merchandise advertisement presents several appliances. The first step was to divide the total cost of the advertisement according to the space each appliance used. Then it was necessary to determine how much of each appliance's share of the cost should be charged to new business, and how much should be charged to a merchandise sales account. This was determined by applying the same percentages which represented the relationship between sales and load revenue in the total budget allowed to each appliance. Suppose, for example, that an advertisement costing $1,000 was occupied equally by advertising for washing machines and irons. Then each appliance must pay for $500 worth of space. By referring to the Final Budget for the year, it was found that the budget for washing machines was $5,000 and that 90 per cent of this, $4,500, was based upon merchandise sales while only 10 per cent or $500 was based upon load revenue. It was found also that the budget for electric irons was $5,000 and that 70 per cent of this, or $3,500, was based upon merchandise sales, and 30 per cent of it, or $1,500, was based upon load revenue. Therefore, of the $500 which washing machines must pay for this advertisement, 90 per cent or $450, should be charged to the merchandise account, and the remaining 10 per cent or $50 to new business. Similarly, of the $500 to be paid for by irons, 70 per cent or $350 should be charged to merchandise, and 30 per cent or $150 to new business. And, of course, in okaying the bill for $1,000, the advertising department would indicate that $800 should be charged to the merchandise account, $200 to new business.

The above routine is now in use and will be adhered to during the year, but because it involves a great deal of detailed clerical work, another method of handling the matter has been worked out and will be recommended for use after this year. If accepted, the new routine will charge all bills to a merchandise account, and will each month pass a credit to that account, so much for each appliance sold during the month. The amount of this credit will be based upon the load revenue earned by the particular appliance. For example, the estimated annual load revenue of an electric iron is $6. If the Budget was built by taking 8 per cent of the load revenue from irons sold last year (or 8 per cent of the load revenue from the number of irons in the sales quota), then it would follow that 8 per cent of the $6, 48 cents, could be credited to merchandise sales for every iron actually sold. If 1000 irons were sold in a month, the amount credited to merchandise sales at the end of the month would be $480. The more irons sold, the greater would be the credit given. A washing machine is estimated as bringing in $2.50 a year in load revenue. Eight per cent of this amount, or 20 cents, is the advertising cost chargeable to new business. If 250 washing machines were sold in a month, the credit to the merchandise sales account to which all the advertising costs had previously been charged, would be $50. There are two great advantages in this routine; it avoids the complicated clerical work of apportioning each piece of advertising and each advertising bill, and it would probably prove a stimulus to greater sales of those appliances on which large credits can be earned, namely, of those appliances which are the best load builders. Each month a report would show the auditing department the sales results and the corresponding credit earned for the merchandise sales advertising account. A single credit carried to the merchandise sales advertising account from a journal entry, with debit carried to the new business account, would take care of the matter. Thus every charge to new business could be accounted for on a logical basis of facts accomplished.

This report of the study has been made in considerable detail, because it is believed that if any utility company is sufficiently interested in the ideas developed to wish to put them into practice, it will wish to see how the investigation proceeded step by step and how the conclusions were reached. It would thus be possible to adopt or reject some of the steps in the procedure as desired. If this study were followed in whole or in part by another utility company upon a basis of its own sales and advertising figures, it is believed that information of great importance to the company would result. If a number of utility companies should make the study, all on like bases, and should report results to the N. E. L. A., data of great importance to the industry would undoubtedly be made available.

PART II.

SEASONAL DISTRIBUTION OF APPLIANCE ADVERTISING

The Study of Merchandise Sales Advertising concerned itself primarily with determining how much of the advertising appropriation to give to each appliance. It also investigated the question of when to give advertising support to each appliance and worked out a simple plan of breaking up the budget for each appliance so as to indicate the months in the year when the money should be spent.

The monthly allotment was made by sales. The records showed, for example, that sales of heating pads had been distributed by months as follows:

Number of Heating Pads Sold Each Month

January	140	April	100	July	50	October	135
February	145	May	85	August	60	November	150
March	140	June	70	September	90	December	485

The above figures are not for one year alone, but are the average results each month over a three-year period. It is immediately evident that the best month for sales has been December, but that sales are made every month in the year. Since January is a month when volume is hard to get, and since it was not deemed necessary to campaign this appliance in order to secure the December sales, it was decided to use a considerable portion of the heating pad advertising budget in an attempt to push a January-February selling season for heating pads. The heating pad budget ($1,000) was therefore divided as follows:

Heating Pad Budget

January	$400	October	$100
February	100	November	100
September	100	December	200

The distribution of sales of this appliance by months is shown more graphically in Chart A which follows. It will also be noted that the plan to develop a January-February selling season in 1929 worked out satisfactorily. These months had been the best ones outside

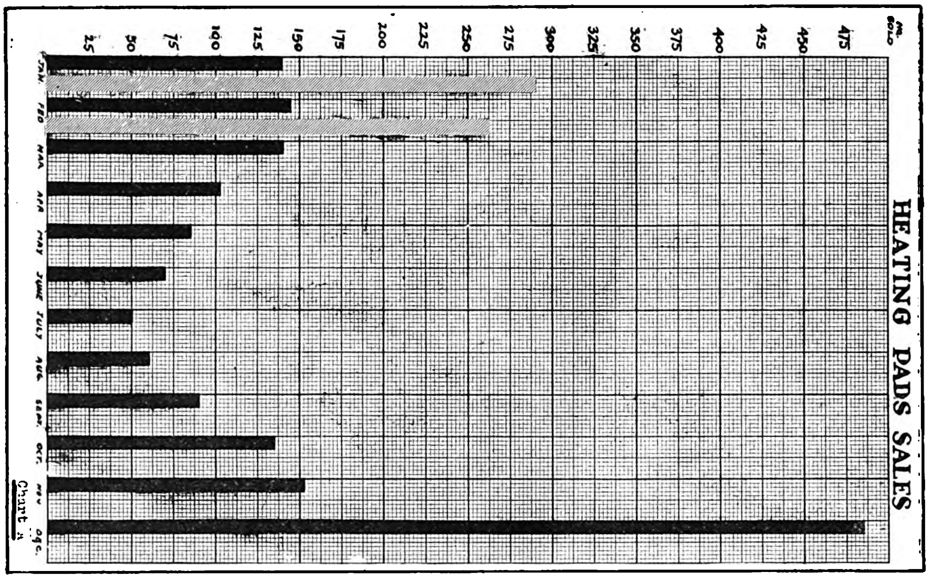

Chart A—Heavy black bars indicate average monthly sales of heating pads for three previous years, while the diagonally shaded bars show January and February, 1929, *sales.*
(turn page to left to read)

of the Fall and Christmas season. A little extra effort made them practically twice as rich in sales.

"Best Sellers" in Electric Appliances

Reference has previously been made in the study, in two or three instances, to certain appliances as being the best revenue builders or the best sales producers among electric appliances. In making the seasonal distribution of advertising budgets, it is very important to refer to data which shows where volume comes from, in getting the sales results of any month. This must always be done so long as the efficiency of the merchandise sales department is judged by the volume of sales it secures, rather than by the load revenue of appliances sold.

Chart B, at bottom of page, lists the five best-selling appliances in each month of the year. Electric irons appear on the list in all but two months. (In those two months, as a matter of fact, they ranked sixth). Electric iron sales are made in considerable volume every month in the year. Iron sales are poor in January compared to iron sales in many other months. Compared, however, to the sales obtained from other appliances in January, iron sales were important. Therefore, a portion of the electric iron budget was set aside to be spent in January advertising.

The rank of appliances, based upon annual results, is given for all electric appliances included in the study, in Chart C which follows. In the first column, appliances are listed according to annual sales, in the second column according to annual load revenue derived, and in the third according to their total income—sales plus load revenue. These lists were also found very helpful as reference material in order to avoid neglecting important appliances.

The Budget by Months

The budget for each appliance was divided for spending in the months

Harriet Billings Prize Paper

The Human Side of a Balance Sheet

By P. O. JOHNSON

IN this day of tremendous endeavor the average person becomes calloused to hearing and seeing large figures. He becomes so familiar with numbers totaling millions of dollars that the presentation of a balance sheet seems to be more a result of mathematical gymnastics than a reflection of industry and endeavor. Men and women outside our industry witness these statements, built up and recorded in perfect balance, yet they perhaps cannot pause in their busy work-a-day world to realize just what is represented in these compilations of figures taken from our industry; yet these statements literally teem with the labors of men and women far removed from accounting practices.

The balance sheet is perhaps the most important report the accounting department is required to prepare. A balance sheet, properly constructed, will reflect sources of capital and the investment of this capital. There is, however, a human element reflected in a balance sheet which is too often overlooked. In this day when the electric industry is facing investigations by Federal and State Commissions it might not be amiss to call to the investigators' attention some human facts reflected in the balance sheet. Suppose we take a balance sheet of the electric industry and examine it to see if we cannot find something in it other than cold figures.

Property Account—the Human Elements

Let us start with the Property Account, which is generally the first item we find on the asset side of the balance sheet. We find in this account, real estate, steam and hydraulic generating plants, steel tower and wooden pole transmission lines, substations for transforming electricity to proper distribution voltages, overhead and underground distribution systems which carry the current to its ultimate destination, office buildings, warehouses and garages. This property is worth over ten billions of dollars today. Let us examine the above and see what this property means to the country and its future prosperity. What has all this done for labor? Can you estimate the millions of dollars paid in wages each year to the workmen who were responsible for the manufacture and erection of all this material, and can you imagine the number of men required to operate these properties?

Mr. Johnson's paper won the 1928-29 *Harriet Billings Prize Award. The author is Traveling Auditor for the Northern States Power Company, and has served in various capacities with the Byllesby Organization since* 1913. *He has been a member of several different N. E. L. A. Accounting Committees during the past eight years*

What does all this property mean to commercial establishments, factories, etc? Manufacturers, through motors connected to machines in their factories, have been able to discontinue their individual steam plants and purchase power a great deal more cheaply from the electric companies. It is no longer necessary to operate an entire factory when only a part of the machines are required. This economy in operation is reflected in the price of the goods manufactured, and is ultimately passed on to the consumer.

What does all this property mean to the home? Electricity has done wonders in the home. Think what it has done to lighten the burdens of housework. A mere turn of a switch and your washing machine starts washing your clothes, an electric range cooks your meal, a dishwasher washes your dishes, a refrigerator keeps your food in good condition, a vacuum cleaner cleans your rugs and furniture; flatirons, mangles, toasters, percolators, curling irons, radios, heating pads and many other conveniences are operated by it. Electricity has changed our standards of living. Isn't there something human about all this? The cold figures on the balance sheet are beginning to warm up a bit and reflect some of the good things about the industry.

What has this electric property done for agriculture? The electric industry has always recognized agriculture as a basic industry and during the past few years many experimental lines have been built to demonstrate the various uses of electrical energy on the farm. Electricity on the farm is no longer a luxury. Standards of living have been changed in the farmers' homes through its use while the farmers are more and more realizing the economic value of electric service. Today electricity on the farm is used for light, cooking, washing, ironing, ventilation, refrigeration, dishwashing, radio, heating, cleaning, sewing, milking, water pumping, sterilizing, separating cream, churning, grooming animals, ensilage cutting, grain and forage grinding, incubator heating, straw cutting, bone grinding, corn husking and shelling, hay hoisting and baling, tool grinding, irrigation, threshing, well drilling, etc. It has been the means of keeping the younger generation on the farms when otherwise many would have gone to the cities to enjoy these modern conveniences. Farmers today can enjoy all the advantages of electricity on the farm without the high taxation rates applicable to urban centers.

Investments—the Human Elements

The next item we generally find on a balance sheet is Investments. Let us examine this account for a minute to see what we will find. We will probably find in this account, the capital stocks of hundreds of small electric plants which have been purchased by the larger companies. These small plants before being taken over by the larger companies were operating old type inefficient steam plants, and their transmission and distribution systems were of old type construction reflecting excessive line losses. These inefficient power plants will be abandoned and the current will be furnished from a transmission line connected to a large efficient generating station. The transmission and distribution system will be reconstructed to the latest type of construction and the economies effected in generation and distribution will be passed on to the community served. Cheaper electricity and better service! One large middle-Western concern that has increased its output of electricity forty-nine times during the last twenty-five years has increased its revenue for this electricity but twenty times. This will give one some idea of how the electric rates have decreased to the public during this period. Isn't there something human about this?

Current Assets—the Human Elements

The next items we generally find on a balance sheet are Current Assets, such as cash, receivables, materials, etc. Executives of large companies are always mindful of the fact that these current items must never get below a certain amount. What does this mean to the public? Suppose the cash account is low, an inadequate supply of material and fuel on hand, and the property is not insured against fire, etc. What could happen? A flood might wreck a power plant, a storm might wreck a transmission line, a fire might destroy property necessary to give electric service, or a strike in the coal fields might cause a shortage of coal. Serious things might happen if a power company should be put out of commission for any length of time. The executives of electric companies, however, keep human welfare in mind by having adequate reserves of cash, supplies and fuel on hand to meet these emergencies quickly so that there may be no serious delay in repairing the property. Is this not human?

Liabilities—the Human Elements

Now we will turn over to the Liability side of our balance sheet, and the first items we find are Bonds and Stocks. Did you ever stop to think where these bonds and stocks are and why they were issued? These bonds and stocks are held by banks, insurance companies, investment houses and millions of individuals. The very nature of the electric industry, the necessity of it, and the things electricity has done for human welfare, makes it a desirable investment. The stability of the investment is one of the prime factors which has permitted the industry to command funds. The consumers of electricity are more and more realizing the possibilities of its use and recently have created a demand for this investment which, in many parts of the country, has exceeded the supply. Employees in the industry have invested millions of dollars in stocks and bonds and are using the interest to raise their standards of living, making happier and better homes. Isn't there something human in all this?

The next items we find on the balance sheet are Current Liabilities, such as notes and accounts payable, accrued interest, taxes, etc. These items represent amounts payable to concerns from whom are purchased supplies, and to local, State and Federal governments. It has always been the practice of an electric company to purchase as much of its material and supplies as possible in the territory it serves. This tends to create better business conditions and prosperity throughout the territory served.

Operating and Depreciating Reserves

The next items we generally find are Operating and Depreciating Reserves. Power plants, pole lines, buildings, etc., through constant use, new inventions and changes, in time become obsolete and must be replaced by larger and more efficient plants, etc. The executives of the industry, looking far into the future, have created large enough reserves to take care of these replacements so that the public may at all times have service from the best obtainable equipment. Human welfare was certainly in the minds of these executives when they gave consideration to adequate reserves for renewals.

Surplus—the Human Elements

The last item we generally find on a balance sheet is Surplus. This item represents the balance of gross revenue after expenses and fixed charges have been deducted and is available for dividends to stockholders, emergency reserves, etc. The millions of stockholders in the industry who have invested their savings look to this account for their dividends. The electric industry is entitled, according to law, to a reasonable return on the fair value of its property. There are a number of people, however, who continue to talk public ownership of electric utilities and who are instrumental in enacting laws which make it extremely difficult to operate under. This not only jeopardizes the industry, but it is detrimental to public welfare because it discourages private initiative. Electric utility service is not a function of government, and a number of State and municipal undertakings in the electrical field have been failures and proved very expensive to the taxpayers.

I have tried in a very brief way to bring out some of the human things represented in a balance sheet, and would like to suggest to all public utility accountants that they bring out the good points of the industry in every possible way, thus increasing their usefulness to the industry.

LIFE

To smile, though games be lost or won;
To earn our daily bread;—
And when at last the day is done
To tumble into bed.

* * *

He took one drink of bad liquor and then stopped drinking.

* * *

Even a yeast cake knows that success depends on work.

* * *

You have to be able to be fashion-able.

Behind the Veil

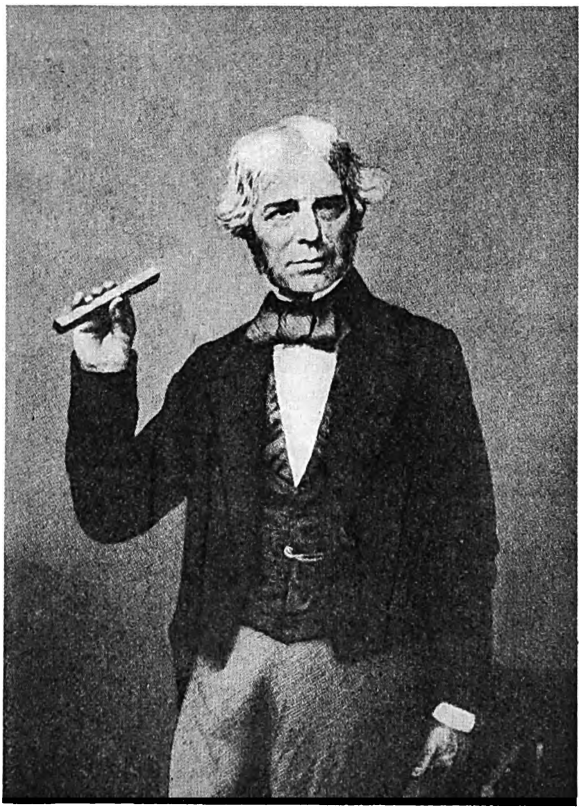
The God in the Machine

By Ernest Greenwood

The eighth of a series of articles portraying against a social-historic background the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

IN 1804, the year in which the German, Albert Winsor, gave his exhibition of lighting with artificial gas in the Lyceum Theater, London, a small, thirteen year old boy was apprenticed to one Riebau, a bookbinder. His name was Michael Faraday and his father, James Faraday, the blacksmith, considered schools luxuries intended only for the wealthy. The boy must learn a trade and the sooner the better. In 1800 or 1801 Sir Humphry Davy, who, next to Faraday's wife, was to become in later years the outstanding influence in the life of the young apprentice, had produced an electric arc, to be followed two years later with a crude demonstration of illumination by incandescence.

IT is sometimes interesting to trace a chain of simple and seemingly unimportant events, when they apparently have led to something which has changed the history of civilization. Had James Faraday decided to make a carpenter or a blacksmith out of his son, or had he had the means to send him to school, it is quite possible that certain books would never have come to the son's attention. Had he not been apprenticed to this particular bookbinder he probably would never have met the customer who gave him a few shillings to buy a seat in the gallery of the Royal Institute while Sir Humphry Davy lectured. Had these things not happened, the development of the electrical industry as we know it today might have been indefinitely postponed. For, out of these simple events came the dynamo, the god in the machine, transforming a few costly laboratory experiments into the greatest physical or mechanical force the world has ever seen. Every invention produced, from the days when primitive man found out how to make rude weapons to the wonders of present day life, pale into insignificance when compared with the dynamo.



MICHAEL FARADAY

Before we begin to follow Faraday through his eventful life, we must once more turn back the pages of history in order to understand just what it was that he eventually produced and why his name has become immortal in the history of electricity and magnetism. The Chinese may or may not have known and made use of the magnetic compass 2600 years before the Christian era—it did not come into use until the fourteenth century. Thales discovered that amber, when rubbed, would attract light objects, and the ancients knew that the loadstone would attract metals. But these were little more than amusing mysteries and hardly worth the serious study of a philosopher.

The glories of Grecian and Roman civilizations came and went, followed by the Dark and Middle Ages with their centuries of alchemy, witchcraft and superstition, until we arrive at the beginning of the seventeenth century and Dr. William Gilbert with his "De Magnete." In this great work he systematized what knowledge there was on the subject of electricity and magnetism, contributing at least one startling idea of his own, which was that the earth is nothing but a huge magnet, thus accounting for the action of the needle in the compass.

GILBERT was followed by Robert Boyle, who was born in 1627 and who wrote a book on "The Origin of Electricity." As Grove Wilson tells us in "The Human Side of Science," Boyle did not know very much about the origin of electrictiy, but "he tossed off one new idea that helped later investigators: the attraction between rubbed amber and the pith ball is mutual."

Otto von Guericke, a German born in 1602, made the first machine for generating electricity. This was nothing more or less than a ball of sulphur revolving under friction. It was only a toy, but it was a generating machine. The Frenchman, C. F. de C. du Fay, who died in 1739, discovered that electricity caused by rubbing glass and that caused by rubbing amber were not alike, thus raising the question as to how many kinds of electricity there are; which question remained unanswered for a hundred years. In 1675, Sir Isaac Newton constructed an electric machine wherein the sulphur globe was replaced by glass, although history has given Francis Hawksbee the credit for being the first to make a machine of this kind. In 1745, the Leyden jar was discovered, and in 1747 William Watson, applying the discoveries of John Wood, the English architect, transmitted electricity over a circuit of four miles—two miles of wire and two miles of ground.

Benjamin Franklin was fascinated by the Leyden jar, but a single jar wasn't big enough for him and he proceeded to show the world how to hook up a number of jars in series, giving him a chance to "store" up a lot of electricity and thus make experiments that were formerly impossible. Until the time of Allesandro Volta, however, scientists had not solved the problem of getting electricity in large quantities.

The Voltaic pile made possible Sir Humphry Davy's electric arc and his experiments of illuminating by incandescence. But even today, while the chemical production of electricity is successful and reasonably efficient on purely physical grounds, it is economically hopeless. The space, weight and cost of batteries, per unit of capacity, is so great as to be beyond all reason as a source of light and power. What was needed was a device for converting mechanical energy into electrical energy, and this device—the dynamo—is the keystone of the electrical industry and of modern power supply generally.

During the years 1804 to 1812, young Michael Faraday continued to bind books in the bookbindery of Riebau, who frequently said to him: "Go ahead Michael; read all you please. You will be no worse a bookbinder for knowing the insides as well as the outsides of books." And so it happened that one day when the young apprentice was binding an encyclopedia he came across an article on electricity. Michael Faraday knew nothing about electricity, but at that time the sum total of all the knowledge in the world was small, and he probably said to himself: "It will not take me long to learn all that is known about this strange electricity, because not much is known."

Next, a book entitled "Experiments in Chemistry" came his way. With what little money he could save he bought cheap and simple apparatus and set to work to perform the experiments it described. His progress, from this time on until his first meeting with Davy, is told in dramatic fashion by Wilson:

"The farther he went along that road the more interesting it became, and the more vivid was his curiosity. No book of science could get away from him. It was a case of genius making a road for itself. Poverty, work, ignorance, were only obstacles around, or over, or through, or under which his spirit would find a way. How he laughed as an experiment came out exactly right! Always in this man there was a great fund of laughing enthusiasm, a dashing audacity hiding behind an honest modesty. Without this audacity he probably would have spent his life as a bookbinder, and the world would never have worn a path to his door.

"What could a bookbinder apprentice want with a seat in the gallery at the Royal Institution while Sir Humphry Davy lectured? But this boy wanted that seat, and he had the effrontery to mention his desire to one of Riebau's customers. It was unheard of, it was preposterous, but the customer was tolerant. It would cost him a few shillings. But to what better use could he put his change? Buying immortality for the price of four tickets to lectures on science!

"Michael went to those lectures. He listened, he made notes, he understood what was said. Later, in his shabby little room at 18 Weymouth Street, he wrote out his notes, elaborating Davy's lectures, proving in this way that he knew what was what and had got the meat out of Davy's words. Did he realize, as he sat laboriously writing, writing, until his arm ached and his head whirled, that he was on the verge of a great change? Who ever realizes a thing of that sort?

"YET a change was needed. This bookbinding was not all roses. Riebau has been all right, but this De La Roche, for whom he went to work as a full-fledged craftsman, was not like Riebau. Hot-headed and emotional, he poured out his words and did his thinking afterwards. For him one bound books and confined one's interests to the outside only. No reading of scientific articles in this man's shop. Get that nonsense out of your head. Michael had been spoiled by Riebau, and this new, harsh task-master constantly rubbed him the wrong way. Also he was now learning things about business and the way it was carried on — and the more he learned, the more he felt it was not for him.

"But how to get away from it? There was the call of science, but how could one make one's living at science? Michael was no expert, he had no degree, he knew nothing of mathematics. He had no friends; that is to say, no influence. He was just a poverty-stricken genius, made into a bookbinder, and he was fast learning to hate his trade.

"His rare audacity, hidden behind honest modesty, nerved him. He sat down and wrote the great Davy a letter, enclosing the notes of the lectures as 'proof of my earnestness.' Then he waited, uncertain—more than two-thirds convinced he would never even hear from Davy. Davy was the most popular lecturer in London, one of the greatest scientists in the world. How could he take time to answer a letter from a poor bookbinder?

"But Davy answered kindly, and made an appointment for a meeting. By that act he made his most astounding discovery: he found Michael Faraday."

A month later Faraday was employed by Davy as a laboratory assistant at twenty-five shillings, or about six dollars, a week. All the world, as it now sits reading by electric light or whirls across town in electric trains or warms itself before an electric heater, can rejoice in that decision and thank Humphry Davy for giving Michael Faraday a chance.

Six months later Davy took Faraday to Europe with him, and for eighteen months he was little better than a valet to his employer. As Wilson says, "There's a picture for you! The keenest student of electricity in the nineteenth century acting as a valet, body servant, to a proud and irritable man with a proud and silly wife! But at that time 'she liked to show her authority, and at first I found her extremely earnest in mortifying me,' said Michael. And this earnestness led to an embarrassing situation in Geneva.

"Continental scientists found Michael worth talking to, and it never occurred to them that he was socially inferior to Davy. Certainly such an idea did not come to Gaspard de la Rive, professor of pharmaceutical chemistry at the Academy of Geneva. Gaspard liked this young Michael, and when the Davys were guests at his home he assumed that they would all dine together. Lady Davy and Davy himself had other ideas and said so. De la Rive was shocked and told the Davys exactly what he thought of the whole business. That didn't help Michael, who dined, solitary, in a separate room." De la Rive should have given a dinner in Faraday's honor, but that would have been too perfect.

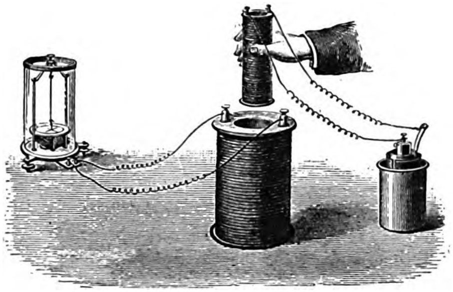
Davy became so jealous of Faraday that when the latter was proposed for membership in the Royal Society he ordered him to withdraw his name. This Michael refused to do, and Sir Humphry, who was then president of the Society, said he would throw the name out himself, to which Faraday replied: "I am sure Sir Humphry Davy will do whatever he thinks is for the good of the Royal Society." The name was proposed, and when the vote was taken there was but one blackball. No one knows who cast it, and it doesn't matter. The valet had become a member of the Royal Society.

In 1820, Davy had magnetized a bit of soft iron by running a current of electricity around it. In 1822, Faraday wrote in his note book: "Convert magnetism into electricity." For nine long years he struggled with this problem. Finally on October 17, 1831, sixteen years before Edison was born and thirty-four years before the crippled Steinmetz first saw the light of day in a cheap flat in Breslau, accident, or fate, favored him. He got hold of a cylindrical bar magnet, three-quarters of an inch think and eight and one-half inches long. He wound 220 feet of copper wire into a hollow cylinder. To this wire he attached a galvanometer. There was no current in the wire.

He brought one end of the magnet close to the wire and there was no movement in the needle of the galvanometer. Suddenly he thrust the magnet all the way into the coil of wire and the needle moved. Drawing it out, the needle moved again. He had found the answer — mechanical movement was needed, and the principle of the dynamo was discovered. All the electrical apparatus that we use today was lying hidden in this discovery and in the simple machines Faraday built from that time on. He had tapped the universal source of electricity.

BEFORE proceeding with the history of the development of the dynamo from this time on, it may be well to stop a moment and ask the question: "Just what is a dynamo?" For the following simple and most satisfactory explanation, the author is indebted to Mr. Alexander Maxwell of the National Electric Light Association Headquarters staff.

> The dynamo produces electrical energy by utilizing the principle of magnetic induction. Magnetic induction is the phenomenon whereby electric currents are generated or "induced" in conductors of electricity by the action of magnetic fields upon them, and, conversely, whereby currents of electricity produce magnetic fields about themselves. A magnetic field is an emanation in space from a magnet or an electric current which for its dimensions may be roughly compared with emanations of light from a luminous source. The magnetic emanation is capable of exerting force and performing physical work, as anyone may observe by the "attraction" exerted by a magnet. Like other physical forces, this one may be utilized, by appropriate mechanism, to do work continuously; that is to convey energy from one form to another.
>
> The presence of induced electricity on an electrical conductor in a magnetic field may be compared with the light present upon the surface of an object itself non-luminous, when it is in a field of light produced by a luminous source. At least one phenomenon is not more remarkable than the other, but that is about as far as the analogy will go, since sensible light does not exhibit the mutual reactions proper to the electro-magnetic field. If we were speaking of total radiant energy instead of sensible light, we might labor the analogy a little more, but this subject is quite as difficult as the dynamo itself.
>
> The next important point is that electricity is generated, not by the mere presence of a magnetic field, but by changes in the strength of that field; in fact, quite strictly in proportion to the rate of change of the field. Thus, a loop of copper wire lying near the poles of a horseshoe magnet, both being at rest, will have no electricity generated in it, although it is immersed in a magnetic field. But if the loop of wire is moved in and out of the magnetic field, or if the magnet is moved to the same purpose, then electricity will be generated in the wire; the faster the motion the more electricity will be generated, in exact proportion; the stronger the magnetic field the more electricity, in exact proportion.
>
> Perhaps it will be seen from this that the magnetic field is a kind of stress; it is energy in storage. And it may also be seen that the conversion of energy is a kind of displacement phenomenon, an adjustment of balances. It is as though, when the wire and the magnetic field were at rest, both had adjusted themselves to the arrangement and were content, the wire to be in that particular strength of magnetic field and the field to have the wire within it. But if a change takes place; for example, if the magnetic strength changes, thereby increasing or decreasing the stress or stored energy, it is necessary, physically, for the wire to adjust itself to this changed condition, and this is accomplished by the flow of electric current, which is itself a transfer of energy. Thus an appropriate rearrangement of forces is accomplished.



The Beginning of the Dynamo

Faraday's experiment with two wire-wrapped bobbins

> Many physical analogies will occur to anyone. For example, the transfer of heat, or better, the conversion of latent to sensible heat, or the potential energy of water at a height, or the weight of a pile driver, where both possess energy, not because they are water or iron, not even solely because they are heavy, but by virtue of the potentiality they have for falling down and expending the energy bestowed on them by gravity.
>
> The dynamo is merely an arrangement of the loop of copper wire and the magnet that produces a magnetic field. It is on a grand scale, of course. The magnets are electromagnets producing very intense magnetic fields, the wires are of many turns and great length, so arranged that the relatively small amounts of electricity generated in short elemental lengths are added together, and mechanical means are provided for continuously moving either the wires or the magnets, such as a steam engine or a water turbine. But essentially the dynamo consists of an arrangement whereby wires may be caused to pass swiftly and continuously through magnetic fields whereby electric currents are generated in the wires, and of arrangements for drawing off this generated electric current from the dynamo to an electric circuit. It is, perhaps, unnecessary to show that for mechanical reasons this is best accomplished by machines having a rotary motion; that is, where the moving part of the machine turns round upon a spindle; so far as theory is concerned, the result could be accomplished by a reciprocating motion, such as a shuttle.
>
> If we now assume that the dynamo is working and producing a large amount of electricity which is led out over the external electric circuit and caused to make lamps glow, turn motors and heat ranges, we know that energy is expended in these final operations, and it is reasonable to suppose what is, indeed, the fact, that a certain amount of energy will have been lost on the way. Altogether a large amount of energy in the form of electricity has been expended—dissipated entirely so far as this particular electrical system is concerned.

PRACTICALLY everyone knows that energy cannot be produced from nothing. There is a certain amount of it available upon the earth, and the utmost we can do is to convert some part of this into useful forms. We have our dynamo producing electrical energy, but the dynamo does not spin itself; it is turned by an engine of some kind which obviously does not produce electricity directly, but rather energy in the form of mechanical motion that might equally well be applied to driving a pump or a cotton mill. The dynamo merely converts this mechanical energy into electrical energy.

A fundamental law of physics is that action and reaction must be equal, and opposite in effect. Everyone knows this, but if there should be any doubt, try pushing some object that does not resist, and see if any energy can be expended. If our dynamo should be started up and caused to spin without any external driving force, or say a very feeble force such as a hand-crank, just sufficient to overcome friction, it would generate electricity, and so long as the main switch was open so that no work was done by the electricity, it would turn very well. It would merely be ready to do work, but would not be doing any. If now the switch was closed and some lamps turned on, the electric current flowing to do this work will react upon the magnetic field-drag, as it were, and tend to slow down the machine; indeed, it will slow down and stop if sufficient external force is not applied to overcome this reaction. Clearly the hand-crank will not do, and we must couple up the engine to keep the dynamo turning. Perhaps more lamps and more motors are added to the circuit, more current flows, more reaction tends to slow down or stop the dynamo, and to overcome this the engine throttle must be opened more and more to keep the dynamo up to speed. In this manner mechanical energy is applied and, by the magnetic reactive force exerted in the dynamo, it is absorbed and converted into electrical energy.

The indispensable place of the dynamo in the production of electric power may be shown by consideration of other possible means for producing electricity. There are but three available ways of producing electricity—by the energy of chemical reactions, by converting mechanical energy, and by the direct transformation of thermal energy into electricity. Of these, the latter, although a theoretical possibility, has never been practically solved. The chemical production of electricity has been and still is practiced; on purely physical grounds it is successful and reasonably efficient, that is to say, a large part of the energy of the chemical reaction may be recovered as electrical energy. However, this source is economically impracticable for general usage. The space, weight and cost of batteries, per unit of capacity, is so great as to be beyond reason. The most efficient reagents are relatively rare and costly, and are completely consumed in the process. The kind of electric current produced—a continuous uni-directional current—is technically unsuitable for modern transmission and conversion requirements, and even if it were available cheaply and in large quantities, it would need modulation to be practically useful.

On the other hand, mechanical energy is available in a variety of forms at low cost, and a technically efficient means for converting mechanical energy into electrical energy makes all of this mechanical energy available in a much more flexible and adaptable form. The dynamo is this converter, and it is, therefore, the keystone of the electrical industry and of modern power supply generally.

While Faraday's epoch-making discoveries occurred in 1831, it was not until 1862 that a "practical" dynamo, capable of producing electrical energy which could be used in arc lighting, was built. This was 61 years after Sir Humphry Davy had produced the first electric arc, and no commercial use of the arc lamp was possible until the dynamo of 1862 was produced. In this year an arc light installation was made in a lighthouse in England, and supplied with a current from a dynamo. In 1866, Sir Charles Wheatstone conceived the idea of self-exciting the fields of the dynamo, thus eliminating the permanent magnets and separate excitation. In 1870, Gramme developed a ring wound armature, which in turn was replaced in 1872 by the drum wound armature of Von Hefner Alteneck, this being the type of armature in use today.

By 1877-78 a considerable number of people were participating in the development of the dynamo. Farmer, Weston, Brush, Thomson, Houston, and many other were all playing their part. These men were responsible for the introduction of a great many different systems of street illumination by arc lights, the various systems usually being identified by the name of the man responsible for the installation. It was quickly discovered, however, that these stations installed for street lighting purposes were not on an economical basis, for the simple reason that their product, street illumination, could only be used four or five hours out of the twenty-four.

ABOUT this time the great master of them all — Thomas Edison — appeared upon the scene. He had just completed his experiments in the telegraph field and he set about "sub-dividing" the arc light so that it could be used for interior lighting. The final result was an entirely new type of dynamo known as the constant voltage dynamo for use in connection with incandescent lamps. Without this dynamo the Edison lamp, like all incandescent lamps which preceded it, would probably have remained but little more than an interesting laboratory experiment. Heretofore the arc lamp generators had operated at a maximum of 50 per cent efficiency. Edison startled the world by building, in 1879, a constant voltage dynamo with an efficiency of 90 per cent. Light's Golden Jubilee was quite as much a celebration in honor of this dynamo as in honor of the incandescent lamp.

The first commercial central generating station producing electric current by means of dynamos driven by steam engines was placed in operation on Monday, September 4, 1882, at 257 Pearl Street, New York City. The largest dynamo, of which there were six, was approximately 125 hp. As the use of electricity increased it was discovered that because of the low voltage the central station could not serve customers more than a mile from the dynamo. Had the dynamo of the early eighties remained unimproved, there would be scattered throughout our cities hundreds of small plants. And then George Westinghouse appeared on the scene.

While in Europe, Westinghouse had his attention called to the work of two Frenchmen, Faulard and Gibbs, who had developed a piece of electrical apparatus, called a transformer, which could raise or lower the voltage of a circuit. He immediately secured the patent rights and, in cooperation with William Stanley, an experimental installation was made at Great Barrington, Mass., in 1885. In Pittsburgh, by the fall of 1886, three hundred incandescent lamps were kept lighted over a line two miles long at 1000 volts. Shortly after this the first commercial lighting plant using alternating current dynamos was installed at Greensburg, Pa. The development in 1888, by Nikola Tesla, of the polyphase alternating current motor made this system complete for commercial use.

Almost immediately after the opening of the Pearl Street Central Station in 1882, plants for incandescent lighting purposes sprang up all over the country. But they encountered the same difficulties which had faced the arc lighting stations; that is, their use was limited to the hours of darkness. In 1884, Frank J. Sprague produced the first electric motor for commercial use on the Edison system, giving tremendous impetus to the central station business, since it was now possible to operate the dynamos in the power plant more or less continuously. This, however, is another story.

The first central station was equipped with 125-hp. dynamos. Central stations of today use dynamos of over 70,000 hp. each. The voltage of the early dynamo was 220 volts, while today we find 220,000 volts. The first Edison station had 59 customers; today the light and power industry has approximately 23,000,000 customers. One has only to visit the light and power station in any large city to marvel at the progress of the dynamo since the day Faraday pushed his eight-inch iron bar in and out of a coil of wire.

NOTE: The author desires to acknowledge his indebtedness to Grove Wilson for the splendid chapter on the Life of Faraday in his book "The Human Side of Science." It is one of the first works which has given this great pioneer the credit to which he is entitled. Also, he must thank the University of Pittsburgh for a series of radio lectures including the history of electricity, the dynamo, etc.

The Business of Selling Kilowatt-Hours

A Discussion of the Recent Residence Kilowatt-Hour Contest

By C. E. GREENWOOD

"WE must sell more kilowatt-hours for each dollar of investment, making our equipment work harder and steadier, and the place to sell more electric service is in the home. Domestic sales are, and will remain, the backbone of our business." Such was the pronouncement of Matthew S. Sloan, President of the Association, in his address at the last annual convention of the Association.

We have witnessed a gradual increase in the average consumption per domestic consumer since 1922. In that year the record was 359, and the sales trend has been upward until June 30, 1929, the national average was registered at 478. Some of this increase we can assign to the downward trend in rates, and the introduction of promotional rate forms. But most of the increase is the result of an awakened interest in the commercial field, exemplified by organized effort to promote electric household devices and to sell an all-round electric service, including the refrigerator, range, water heater, oil burner and other large revenue producers.

We are making a fair start in creating greater appreciation of the benefits of electricity on the part of the home-makers.

Incentives to Action

Contests have always been an incentive to action. Most of us will admit that we have needed to inject stimulation into our selling. Such a stimulant was the Residence Kilowatt-Hour Contest inaugurated by the Merchandise Sales Committee of the Commercial National Section in 1927.

The contest was open to all Class A members of our association, and prizes were offered in three classes for the greatest increase in average kilowatt-hours sold per resident customer during the calendar year 1928 over 1927. All contestants registered at N. E. L. A. Headquarters before April, 1928, the average number of kilowatt-hours sold per domestic customer in 1927. They registered again before April 1, 1929, the average number of kilowatt-hours sold per customer during 1928.

Contestants were divided into three classes in accordance with the size of their residence business as indicated by previous sales records. In Class A there were grouped those that registered an average of 451 kw-hr. or over.

Mr. Greenwood is Commercial Director of the National Electric Light Association

In Class B were grouped those from 351 to 450 kw-hr. per year, and in Class C those selling 350 kw-hr. or under at the start of the contest.

It was expressly stipulated that all current sold during the contest period must be "metered," and that all current in the reckoning must have been sold at domestic rates and for domestic purposes. "Average domestic consumption" was based on *family units* and not on *number of meters*. The eligibility rule on metering eliminated two companies making outstanding records in increase, one of 243 kw-hr. and another of 178 kw-hr. in one year.

The immediate purpose of the contest was to direct commercial thought to domestic load factor, and the increase of kilowatt-hour sales through the products of utilization. It appeared to the committee that too much attention was being paid to *volume* of sales, and the committee was confident that ultimately the contest would stimulate appliance selling and general commercial activity.

The prizes were $2,000 and $1,000 in cash for first and second prizes respectively in each group. A fund of $9,000 was raised for the purpose, contributions from electric manufacturers making possible this activity. The writer desires to express here his wholehearted appreciation for the willing cooperation of manufacturers in this notable effort of the Merchandise Sales Committee. A list of contributors to the prize fund is published on the next page.

Although a total of 156 companies registered their entries, for good and sufficient reason some did not finish and did not register results. A list of 100 competing companies with their record of achievement begins on the next page.

Prizes Awarded

Prizes were awarded in the three classes as follows:

CLASS A

First Prize: Cheney Power & Light Company, Cheney, Wash.

Second Prize: San Joaquin Light & Power Company, Fresno, Cal.

Honorable Mention: Portland Electric & Power Company, Portland, Ore.

CLASS B

First Prize: Alabama Power Company, Birmingham, Ala.

Second Prize: Western Public Service Company, Scotts Bluff, Neb.

Honorable Mention: Durham Public Service Company, Durham, N. C.; Connecticut Light & Power Company, Waterbury, Conn. (These two companies made equal record of increase.)

CLASS C

First Prize: Central Power and Light Company, San Antonio, Tex.

Second Prize: Western Public Service Company, Beaumont, Tex.

Honorable Mention: Annapolis and Chesapeake Bay Company, Annapolis, Md.; Montana-Dakota Power Company, Minneapolis, Minn.

A full transcript of what the winners say on "how it was done" cannot be recorded here, but excerpts from statements of the men responsible for the load-building effort will be of interest. Here are some of them:

"We used every method known to good electrical merchandising," said B. R. Lean, manager of the Cheney Light & Power Company, Cheney, Wash., winner of the first prize in the Class "A" group. "This included newspaper advertising, bill enclosures, bill boards, house-to-house canvas, cooperation with other merchandisers in the communities, tie-in with all national concurrent campaigns and well-paid employees. Extra bonuses were given for certain volumes of business reached. We had theater parties and banquets. 'Our Friendly Campaign' was the name given it, and this will be of far more value to us in the years to come than the

MANUFACTURERS CONTRIBUTING TO THE NATIONAL CONTEST FUND

- Acme Electric Heating Company, Boston, Mass.
- Altorfer Bros. Company, Peoria, Ill.
- American Electrical Heater Company, Detroit, Mich.
- American Ironing Machine Company, Chicago, Ill.
- Apex Electrical Manufacturing Company, Cleveland, Ohio
- Automatic Electric Heater Company, Chicago, Ill.
- Automatic Washer Company, Newton, Iowa
- Bryant Electric Company, Bridgeport, Conn.
- Chicago Flexible Shaft Company, Chicago, Ill.
- Edison Electric Appliance Company, Inc., Chicago, Ill.
- Electric Household Utilities Company, Chicago, Ill.
- Electric Vacuum Cleaner Company, Cleveland, Ohio
- Eureka Vacuum Cleaner Company, Detroit, Mich.
- Federal Electric Company, Chicago, Ill.
- Frigidaire Corporation, Dayton, Ohio
- Gainaday Electric Company, Pittsburgh, Pa.
- General Electric Company, Refrigeration Dept., Cleveland, Ohio
- Graybar Electric Company, Inc., New York, N. Y.
- Hamilton Beach Manufacturing Company, Racine, Wis.
- Handel Company, Meriden, Conn.
- Hoover Vacuum Cleaner Company, North Canton, Ohio
- Kelvinator Corporation, Detroit, Mich.
- Kitchen Aid Manufacturing Company, Troy, Ohio
- Landers, Frary & Clark, New Britain, Conn.
- Liberty Gauge & Instrument Company, Cleveland, Ohio
- Lightolier Company, New York, N. Y.
- Lindemann (A. J.) & Hoverson Company, Meriden, Conn.
- Manning Bowman Company, Meriden, Conn.
- Miller Company, Meriden, Conn.
- Oil Heating Institute, New York, N. Y.
  - Bryant Steam Corporation, Peru, Ind.
  - Cleveland Steel Products Company, Cleveland, Ohio
  - Electrol, Inc., St. Louis, Mo.
  - International Burners Corporation, New York, N. Y.
  - May Oil Burner Corporation, Baltimore, Md.
  - McIlvaine Burner Corporation, Evanston, Ill.
  - Minneapolis Honeywell Regulator Co., Minneapolis, Minn.
  - Petroleum Heat & Power Company, Stamford, Conn.
  - Preferred Oil Burners, Inc., Peoria, Ill.
  - Silent Automatic Corporation, Detroit, Mich.
  - Timken Detroit Company, Detroit, Mich.
- Radio Corporation of America, New York, N. Y.
- Robeson Rochester Corporation, Rochester, N. Y.
- Rutenber Electric Company, Marion, Ind.
- Swartzbaugh Manufacturing Company, Toledo, Ohio
- Syracuse Washington Machine Corporation, Syracuse, N. Y.
- Walker & Pratt Manufacturing Company, Boston, Mass.
- Waters-Genters Company, Minneapolis, Minn.
- Welsbach Refrigeration Company, Gloucester City, N. J.
- Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.
- Williams Oil-O-Matic Heating Corporation, Bloomington, Ill.

success of this one year in building a load. Friendliness did not only apply to the public, but we instructed our employees to meet competition in a fair and friendly way, regardless of the method used by competitors. The idea was to sell the company first and then the appliances that the company's name was back of and which in time to come they were compelled to give service."

The Cheney Light & Power Company promoted the complete line of electric appliances, including ranges, water heaters, ironers, refrigerators and radios. They did not forget to increase candle power per socket. A special package of lamps was made up and sale was increased on the higher wattage lamps.

"In no case did we cut the price to make a sale," said Mr. Lean, "not even in competition, as we felt our customers must have the confidence that they were not buying an inferior article."

We asked A. B. Collins, manager of the Merchandise Sales Division of the Alabama Power Company, Birmingham, Ala., winner of the first prize in the Class "B" group, "how it was done." "In brief," he said, "definiteness was given to the contest by the adoption of a slogan and popularization of it throughout the company; an ample selling plan was developed to tie-in directly with the contest, and then load building appliances were featured through intensive selling campaigns." From which we concluded that the record was not of an individual or a department, but a company record established with support from Thomas W. Martin, chief executive of that company down to the office boy.

The exhibit of the Alabama Power Company, showing its numerous printed bulletins, forceful and overflowing with enthusiasm, was an outstanding feature. And best of all, they are off again for another record without any national contest. They are out for "One More Kilowatt-Hour Per Day."

Again we find executive support and complete employee support in the selling program of the Central Power & Light Company of San Antonio, Tex., winners of the first prize in Class "C." "The Commercial Department prepared a booklet which puts the district managers in the position of being respon-

32.	Molalla Electric Co.	Oregon	259.00	229.00	30.00

sible for their district doing its share toward winning high honors for the company," wrote J. R. McCoy, manager of the Commercial Department. "The plan went down through every employee and at the regular monthly meetings the contest was called to their attention. Then there were scheduled campaigns on ranges and other load builders, with three cooking schools held each day throughout the year. A feature of these schools was the education of present users in the proper use of their electric ranges, this work being done by our Home Service Department."

The Central Power & Light Company likewise increased its lighting wattage by the organized selling of 60-watt lamps. "Consistent selling of electric devices with electric service was stressed, and competition within the organization really accomplished results."

So with other winners. The San Joaquin Light & Power Company started their local campaign with an objective of 100 kw-hr. increase, and finished with 99. A. M. Frost and his commercial departments conducted fairs, cooking schools and continuous demonstrations of electric devices for the home. During 1928 there were sold 1600 ranges and over 1000 water heaters were added to the lines.

Western Public Service Company at Beaumont, Tex., likewise mobilized the selling power of the employees and used every constructive promotional effort. Here the "district representative" plan is in operation. In the report submitted by J. G. Holtzclaw, it is interesting to note that nearly 200 houses within reach of the distributing system, a large majority of which were occupied by negroes, were wired during the year. Certainly this is an indication of intensive selling.

Another Stone & Webster property, Western Public Service Company of Scottsbluff, Neb., was the winner of a prize, and applied sales programs which paralleled somewhat those of the sister company in Texas. "Every man in the company was inspired with load building interest," said M. T. Anthony, the sales manager. "We knew they were able to do the job if the responsibilities of building the company's load were explained to them. The employees were rated on the point system. It is of unusual interest that a cashier won that contest, his sales of merchandise approximating $13,000. Contests, sales campaigns and educational mediums played an important part in upholding continued interest."

Meriting special mention, is the practice of all successful companies in promoting the ultilization of electric appliances in the home, with equal force with the selling of the products them-

selves. This was the dominating policy of the winners in the contest. The writer wishes he had space to bring out many other details of the highly organized selling plans of all winners and others who presented outlines of their commercial activity. It would make inspirational reading.

The advice of Henry Ford has not fallen on deaf ears. "Getting electricity into the minds of the people" is our commercial objective, in the domestic field. It is the business of selling kilowatt-hours of diversified service in the home, and in the commercial and industrial field as well. The home is our major concern. The contest was an object lesson. What has been done by a few can be done by many. The Residence Kilowatt-Hour Contest, which a group of appliance manufacturers made possible, was the spark to fire selling action. Executive support was given and employee interest was registered. Records were rolled up by those who were hitting on all six, that is, the winners

Stressed the load builders
Increased wattage of sockets
Conducted consistent campaigns
Applied effective advertising
Promoted home service
Cooperated with the dealers.

We register another successful load building activity of the Commercial National Section.

Japanese Mission Guests of Association

A GROUP of seventeen prominent officials from the Japanese electric lighting and power companies, representing public utility companies with an aggregate capitalization of approximately $500,000,000, were the guests of the National Electric Light Association at Association Headquarters, the afternoon of October 3. The mission was told of the work of the association by Secretary A. Jackson Marshall and representatives of the various departments.

The special service which is sometimes rendered by the representatives of the Headquarters' staff to members of the Association is indicated in the talk given by C. E. Greenwood, Commercial Director.

On October 2nd, at the Studios of The Miller Company, Mr. Greenwood outlined the demand for better illumination in the homes and commercial buildings of the United States, and analyzed the market for new fixtures and portable lamps and the effect of the increased lighting load on the investment efficiency of the power companies.

Statistical data was presented on charts, the text being printed both in English and Japanese.

Capital turnover which occurs once in approximately five and one-half years in the United States extends over six years in Japan. The Japanese have a marketing effort to perform in the selling of electricity which somewhat parallels the situation in this country.

This lighting mission, traveling under the auspices of the Tokyo Electric Company and the International General Electric Company, is in the United States to study modern lighting installations and methods, and the administrative and engineering problems of the central stations which supply electricity in this country.

The personnel of the mission follows:

H. Ihara, Micgodo Electric Company; T. Hata, Niigata Hydroelectric Company; M. Kihara, Tsikoku Rengo Lamp Company; S. Kunitome, Chuo Electric Company; U. Mori, Toho Electric Power Company; H. Miyata, Kyushu Electric Railway Company; K. Murakami, Kyushu Hydroelectric Company; R. Musha, Keijo Electric Company; J. Nishida, Osaka Lamp Company; K. Ogata, Kumamoto Electric Company; B. Sakaguchi, Hiroshima Electric Company; F. Sato, Osaka Electric Power Company; K. Sugiyama, Tokyo Electric Light Company; K. Takecki, Iyo Electric Railway Company; T. Yamashita, Osaka Municipal Electric Department; S. Tejima and H. Sakai, Tokyo Electric Company.

The Japanese Mission

Cheaper Wiring

A Matter of Vital Concern to the Industry and the Public

By H. S. Bennion

I HAVE been asked to address you on the subject of "Cheaper Wiring." In doing so I shall assume that you desire to hear something of the economic side of house wiring. As inspectors you are frequently having to decide the probable degree of acceptance by the purchasing public of proposed or adopted safety provisions which will in some measure affect the cost of house wiring. On this account you are interested in the economics of wiring.

I shall assume that fundamentally it is a matter of indifference to you whether houses are wired cheaply or very expensively, just as it is not the concern of building inspectors whether a prospective householder decides to build a five thousand dollar or a twenty-five thousand dollar house, these being matters for the purchasers individually and collectively to decide for themselves.

I believe that this collateral interest in the cost of wiring is a matter of legitimate concern to the inspectors, as experience has amply shown that excessive requirements inevitably lead to evasions of one kind or another, usually, of course, after the initial installation has been completed and accepted. It is generally true that excessively burdensome requirements lead to disregard for the necessary along with the unnecessary requirements. There is a fairly definite limit of public tolerance of laws and regulations of all kinds.

What We Mean by Cheapness

Now with respect to cheapness, we must define what we mean. It is fundamental that specific cheapness is desirable in itself; all commodities and all services without exception are more desirable at a lesser cost than they would be at a greater cost. Cheapness, of course, must not mean shoddiness or failure to meet necessary provisions for safety, but cheapness meaning low cost need not mean lack of safety, just as high cost does not mean safety.

All groups of commodities useful to our civilization have wide variations in degree of fineness and cost within their groups, and all of them that survive competition have definite utility. There is, of course, the familiar example of the motor car where both second-hand Fords and custom-made foreign cars each have an approprite and useful place in the market, although with a cost ratio between the cheapest and costliest of perhaps one to two hundred. There are, of course, all of the grades in between these extreme limits. There are innumerable other examples. Costly fabrics are appropriate for our Sunday clothes, but denim is not only good enough but actually better for working in the fields, and so examples might be multiplied indefinitely. It may be said that engineering materials do not follow the same laws on account of the restrictions imposed by technical requirements, and this is true, but only in degree. Even steels used for construction purposes will vary in their cost ratio by about ten to one. Nevertheless, the principle prevails that the cost of an article should be no more than that appropriate for its intended use, and the mere fact that something more expensive exists does not necessarily make it desirable for uses where cheaper things are appropriate.

Major Bennion is Director of the Engineering Department, N. E. L. A. This address was made before the Northwestern Section of the International Association of Electrical Inspectors, at Vancouver, B. C., September 11, 1929

On the whole, it seems to me that anyone who knew this and also knew that electric house wiring must suffice for various services, from the heaviest and roughest industrial plants or luxurious places to the most modest dwellings, would normally expect to find a rather wide range of types and unit costs, perhaps of the order of ten or fifteen to one. The reverse of this condition, whereby one or a few types attempt to serve such diverse ends, should be regarded as the extraordinary situation.

In the case of electric wiring, it is certainly desirable, from the point of view of all concerned in any degree with the electrical industry, that building owners should be persuaded to spend as much as possible upon their electrical installations. In the nature of things, this must be a matter of persuasion, since the owner has it completely in his hands to do as he pleases about it; that is, to put in a small amount of very expensive wiring or much more of less expensive wiring, or in the case of a structure already built, to decide to get along with what he already has. The question, therefore, is whether he shall use expensive wiring, in which case he will inevitably use as little as possible, or at least he will get less in terms of outlets for his limit of expenditure, or whether, on the other hand, he shall employ an inexpensive type of wiring and install a great deal of it.

Manufacturers' and Contractors' Interest

So far as the trade is concerned, it should make very little difference to manufacturers, since they would sell about the same money's worth in either case, although there may be a slight preference for the cheaper articles in harmony with the general trend of American commerce toward the distribution of great quantities of commodities at low unit costs.

It should be a matter of indifference to the contractor since his profit is proportionate to the total cost of the job, and the choice is in favor of labor since with less costly types for the same total amount of money expended upon wiring the amount devoted to labor will be proportionately greater. From the point of view of the central station there is, of course, no question since their whole commercial program depends upon increasing the means by which their customers may freely use electric power.

It is especially appropriate at this meeting to consider the relation of the inspector to this matter, and it appears to me that from the point of view of his daily work and the results that he hopes to achieve there can be no question as to his choice. Practically all of the evils with which inspectors are concerned are those due to the abuse of wiring and not to the proper use of any approved methods or materials. People put pennies in fuses or bridge them, not from sheer malice, but because they are overloading circuits. The obvious cure for this is to provide more circuits, heavier circuits and more outlets. Flexible cords and excessively long portable cables are draped all over houses and even extend from room to room or, as it has been reported, even from floor to floor. The remedy again is in the provision of additional outlets so that it will actually be easier to plug the connection into a proper receptacle than to drag cords all over the place.

The Remedy

The remedy for these and many other evils traceable to the same source lies in the installation of house wiring that is complete for modern necessities in the use of electricity. It is a considered view of the executives of electricity supply companies and their sales experts that this will not be accomplished with the more expensive forms of wiring now on the market. This is undoubtedly an impartial and dependable verdict since electricity supply companies would have everything to gain if new outlets could be installed by means of such types of wiring, and no one would be happier than they to see it done. It may be taken as a fact then that the truly adequate wiring of new houses and the modernizing of the wiring in existing installations definitely require means for wiring at much lower unit costs than those available in many localities. This means not only the continued recognition of the simpler forms of wiring that have been shown by experience to be satisfactory, but it means as well the development of new methods of wiring that will still better meet the requirements. In addition to this it is of the utmost importance that every means for shaving costs in all systems of wiring should be utilized.

It should be noted at this point that the views of the central station executives are positive rather than negative. They are not opposed to any recognized commercial product and they desire to promote the use of all of them. They hope for the installation of every foot of rigid conduit that the traffic will bear, and all the armored cable and metal surface raceway as well. In addition they desire to promote the free use of all other systems of wiring, those that are known as well as those that have yet to be developed, upon the single condition that they comply with the indispensable provisions for safety.

Our executives feel it to be essential that there shall be some systems to supply the demand for low cost wiring. The view has been expressed from time to time in various quarters that there were already too many kinds of wiring. This has little or nothing to do with codes or inspectors since it is obvious that any systems complying with requirements must be recognized although there be scores of them. It has economic importance certainly but the remedy is also economic, namely, that diversity of this kind will cure itself by the inevitable victory of the best systems, that is those having the best utility.

The Matter of Safety

It may reasonably be asked what objections there are from the point of view of safety to the cheapest possible forms of wiring. The only possible answer is that there can be no objections to any type of wiring as long as it complies with necessary minimum requirements for safety. It is of the utmost importance to observe that these shall be minimum requirements. It is entirely possible that some forms of wiring may have additional factors of safety which render them valuable for certain special applications, but unless the degree of safety that they afford is indispensable in a particular situation, why make the expenditure? The mere existence of exceptionally rugged types of wiring, such as rigid conduit, does not imply that their use is necessary or even desirable in situations where the particular requirements for such ruggedness do not exist, and it is in this respect that amateur attempts at drafting regulations most frequently fail. There is a natural tendency to play on the safe side and to make normal those exceptional requirements that may actually not be required one time in a thousand.

At this point it may be appropriate to examine the records to see if possible what circumstances create a moral obligation for new or special provisions for safety, that is to say, provisions in excess of those which we have got along with in the recent past. If any types of wiring or any established safety methods are deficient it should appear plainly in the record. In discussing this I shall confine my remarks to the hazard of circuits less than 150 volts to ground because this has appeared to be the focus of controversial opinion, some saying that there were great numbers of people being killed at this voltage and others denying it.

When this subject was debated recently, it was revealed that no one really knew anything about it. It is an actual fact that sincere men were urging measures which would have had profound effects upon a great industry upon a basis of rumors and conjectures, when upon investigation it appeared that they had no positive knowledge whatever of the prevalence of the hazard; indeed, such knowledge did not exist. Various interested parties thereupon undertook to collect the necessary statistical and other information and among these was the N.E.L.A. I shall, of course, refer to the investigations of the N.E.L.A. which, although they are not nearly as complete as they will be in the course of the year, and not complete enough to justify the public announcement of even preliminary data, are still interesting enough in view of this occasion for me to venture some personal and informal estimates.

I find from examination of the records for the past five years from a substantial fraction of the population where electricity is available in the United States that it is probable that the general rate for authentic fatalities at less than 150 volts to ground will be much less than one fatality per million inhabitants per annum, and that there is no indication of a systematic increase in the rate. This figure is the total for all authentic fatalities established from public official sources at this voltage, except public utility employees working upon public utility plant (and I may say parenthetically that these were very few in number at this voltage). It is, therefore, a gross figure without reference to technical code questions.

Application of Codes

Now as to the application of the codes, I find the state of affairs about as follows. About one-quarter of the cases were those of persons making repairs or tinkering with electrical devices, or doing unusual and unpredictable things, some of them astonishing in their novelty, and all quite beyond the ability of any code to anticipate. My impression is that nearly half of all the cases will be accounted for by the persons killed in bath tubs and those in boiler drums or the equivalent. It is quite evident that ordinary metallic contacts are not fatal at this voltage, and equally evident that dampness and moisture, in the ordinary sense of those words, are not hazardous.

It is my opinion that, aside from the bathtub and boiler group, and the "non-code" group, there will be in the whole country a residue of five to ten cases annually where, if all of the circumstances were known in advance it is conceivable that code provisions could be devised that would prevent them. But—these residual cases appear to have no features in common; they do not repeat themselves, and there seems to be little relation to any generalized methods for safety, such as grounding, or isolation or insulation. It has never been contemplated, and it is not now conceivable that the codes can provide for the individual case, however unfortunate that may be.

This exhibit, if it is confirmed by more complete data, and it is my conviction that it will be, is a splendid one for the art of house wiring. It means that the personal hazards inherent to the use of electricity at lamp voltages are negligible save for one or two identifiable weaknesses and it is to be borne in mind that this exhibit applies to the art as it stands—to the very oldest as well as the newest installations, to the lamp cord method of wiring and all of the other variants unknown to the code, and to the shoddiest and most disreputable appliances; a little education should cure most of this trouble. Under these circumstances does it not appear absurd to denounce systems showing a modest departure from some of the conventional ideas, as a breakdown of indispensable code standards?

The "Standard" in Homes

Almost any real system of wiring would be an improvement on the lamp cord method of wiring, the one system now "standard" in American homes. In general, the mere fact that a new system, or a modification of an old system is openly and frankly advocated by any competent persons should bias you in its favor, because as inspectors you know well that extra-code, uninspected and indefensibly bad wiring is actually going in all about you continually, and you know moreover that even reinspection, where it is practised, has not proven effective to abate these practices.

I am, as you see, asking for an open mind when you meet and deal with new methods and new modifications in old methods. That you will meet and deal with them is a certainty. Some are already in the field although not in the code and you know about them. Others will appear, and whether they appear first in the code or in the field will depend very largely, almost wholly, indeed, upon the ability of the electrical inspectors of the country collectively to deal on engineering lines with the appearance of these new methods and materials for wiring. The problem when these appear will be whether you inspectors will elect to compare them with the special merits of existing wiring systems or whether you will view them as possible eliminators of the housewife's effort to solve her wiring problems.

I am predicting the advent of new, simpler and probably cheaper wiring methods not altogether because I have information about it. I have some information of new developments being tried out and of others underway, but I am not at liberty to reveal it in detail at this time. But if I did not have such information I could speak with almost equal confidence, for it is obviously in the order of things. Electric power is cheap and getting cheaper, it is now a familiar, commonplace thing, the demand is in healthy shape and is constantly being stimulated by new applications that are useful and attractive to nearly everyone—central stations and dealers do their utmost to persuade the people to use more and more electricity. House wiring is the neck of the bottle. No less an authority than the chairman of our Commercial National Section has so stated. Can anyone believe that this particular art will remain unchanged, with every thing changing about it? Consider the manner in which hard roads followed the motor car, the changes following the radio, the speed with which cinemas have been re-equipped since the advent of talking pictures, and ask whether any technical system can withstand the pressure of a new necessity. Each of these, and many others readily recalled, meant the scrapping of plant and very good plant, of ideas and prejudices.

Change Must Come

Of all things in the electrical world, why should it be expected that materials or methods that were sufficient ten years ago, or five years ago, should be sufficient today solely in the house wiring art? It is not true of prime movers or electrical machines, or switches, or transmission and distribution lines. It is not true of our ideas concerning the utilization of power or of lighting. Especially it is not true of the social and economic aspects of the electrical industry for what was a luxury has become a necessity and will be so regarded in all of its aspects. Is it not evident that this must profoundly affect all of our ideas concerning house wiring?

My purpose in coming here has been to talk with you frankly about the things that are taking place in the house wiring field and to ask your sympathetic aid to the electricity supply companies in working out the code problems with which they are being confronted in their dealings with the public. We want you to feel confident that we have the safety of the lives and property of our customers at heart, and we wish to assure you that we will seek the experience of trial tests and the advice of engineers of high attainments in the electrical field before proposing for general adoption important departures from previous practice. We feel assured you will consider these matters with an open mind and judge proposed changes on their engineering merits and in accordance with facts.

Correction

A REGRETTABLE error occurred in the makeup of the article, "The Flexible Cord Problem," by Arthur P. Good, page 661, October issue of the N. E. L. A. BULLETIN. The concluding three paragraphs of the article were transposed so that they appeared near the middle of the article, while the two concluding paragraphs were again repeated in their proper position.

The following changes should be made for a correct reading:

Delete last two paragraphs of article and transpose, in their place at the end of the article, the three consecutive paragraphs beginning with the last paragraph in center column, page 662 (first line of which reads "All of these wiring jobs that we have") and continue through the next two paragraphs in third column, page 662 (last line reads "the carpet, 25 feet to the new radio set").

Amplifier Article

(*Continued from page* 703)

purpose of merchandising electrical appliances, meaning increased comfort in the home and increased consumption for the light and power company. Forgotten, or ignored, is the fact that increased consumption is almost invariably followed by a reduction in rates, which under regulation means that the consumer and not the company gets the benefit of the results of this advertising, if the company already is earning a fair return. The company is damned if it does not try to increase consumption so that it can reduce rates; or it is damned if it adopts ordinary business methods in an attempt to increase consumption so that it can reduce rates. In other words, no matter what it does, it is wrong, and should not even be allowed the opportunity to prove, by the publication of solid economic and social facts, that it is right, because this might create a favorable attitude on the part of public opinion.

In fact, the position in which the light and power industry finds itself today is reminiscent of that famous story from Don Quixote, where the lord of a great land set up a high court at the end of a bridge which crossed a river bounding his domain. To this court he gave instructions along the following lines: Whosoever seeks to enter the country and tells the truth about his business, then shall he be allowed to go about that business. But if he tells a falsehood, then shall he be hanged by the neck until dead. And it so happened that a young man sought to enter the country and was asked by the court as to his business there. "My Lords," he replied, "I have come to be hanged."

The electrical industry is meticulously truthful in the material it sends out for the information of the public, but it has no intention of being hung, and a vast majority of the American public have no desire to see it hung, nor will they permit it to be hung, however pleasing that spectacle might be to those whom Sir Ernest Benn calls "the incompetents, the parasites, the passengers, the incapables and the pauper-minded."

Changes in Format and Method of Handling N. E. L. A. Committee Reports

By A. JACKSON MARSHALL

Secretary, National Electric Light Association

EDITOR'S NOTE: It is believed that a broader understanding of what the Association offers to the individual employees and the officers of member companies, as well as to the companies, can be gained through a better knowledge of the character of N. E. L. A. committee work and the service operation which makes reports of the committee available to every person in the industry. This article is the first of a series which will describe some of the services offered through the cooperative work of the Association's members. A description of the mechanics involved in the production of committee reports will constitute the next article in this series. It will appear in an early issue of the BULLETIN.

IN keeping with the need for presenting N.E.L.A. committee reports in the most useful form for the reader, and as economically as practicable, the style of presentation has, from time to time, undergone changes. Beginning with the new administrative year, several improvements have been made in the format of the reports. Such changes have been made with these objectives in view:

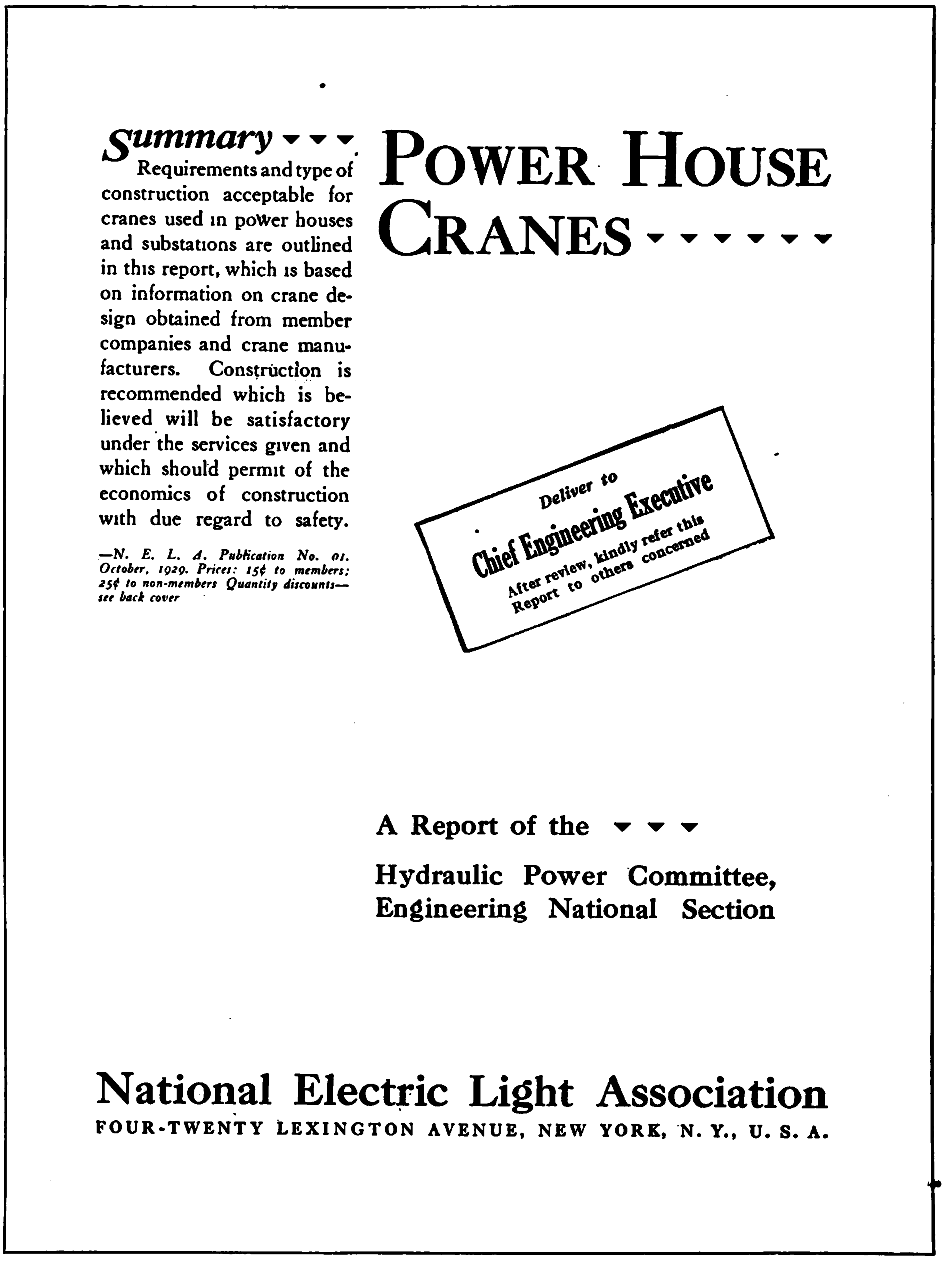
1. Greater ease in reading
2. Presentation of scope of report on cover so that it may be quickly assimilated
3. Greater flexibility in handling text and illustrations
4. A design in keeping with modern typographical trends
5. Greater economy of production.

In addition to the title of the report, there appears on the front cover a brief summary, so that the busy executive may determine at a glance the nature of the report, and, after perusal, direct it to others concerned in his organization as suggested on the colored sticker. Other information, including the name of the committee that prepared the report, the publication number, date of publication and prices, also appears on the cover.

To facilitate quick perusal of the report, a complete contents is listed separately on the inside front cover page. The report proper begins on the first right hand page. The body of the report is set in an easily read (Caslon) type face on a 3-column page, similar to the page on which this is printed. The narrow column is more easily read than the wider column used formerly, and it also presents the following additional advantages: (1) Greater flexibility in the size and arrangement of illustrative and tabular matter; (2) A reduction in the number of pages required for printed reports, which consequently curtails the growing size of the Association's annual proceedings; (3) Greater economies in publishing costs.

The body of the report concludes with the committee (and subcommittee) personnel. On the back cover is printed a price list of current publications of the particular section concerned.

Formerly it was the practice for committees to prepare an annual report which was printed in pamphlet form. The report was presented by the committee chairman at the annual convention of the Association and copies were distributed to delegates. This method, however, had many disadvantages, chief among which were the time consumed in presenting the reports at the various meetings of the convention, and the



Summary ▾ ▾ ▾

Requirements and type of construction acceptable for cranes used in power houses and substations are outlined in this report, which is based on information on crane design obtained from member companies and crane manufacturers. Construction is recommended which is believed will be satisfactory under the services given and which should permit of the economics of construction with due regard to safety.

A Report of the ▾ ▾ ▾

Hydraulic Power Committee,
Engineering National Section

National Electric Light Association
FOUR-TWENTY LEXINGTON AVENUE, NEW YORK, N. Y., U. S. A.

Typical cover page of newly designed N. E. L. A. Committee Reports loading up of delegates with copies of reports which were not read at the time, and which, in many instances, were never seen by the individual after the convention. The method likewise limited the committee to the one annual report which had to be published by a definite date prior to the convention. Naturally, this brought an excessive peak load production which usually results in inaccurate presentation and high costs.

Now, the regular procedure in presenting committee reports provides for the preparation of one or more reports by a committee during an administrative year, and the prompt dissemination of this information to the industry. Thus the compilation of important data by a committee during the administrative year can immediately be made available to the industry, rather than holding such information for an annual report at the close of the administrative year as was formerly the case.

During the past several years, such reports were termed "Serial Reports" to distinguish them from the "Convention Reports" previously published. This procedure is now well enough established, so that it has seemed advisable to discontinue the use of the word "Serial" in connection with committee reports, inasmuch as in most cases each report is complete in itself and is not one of a series. Where a subject may be divided into two or three reports, as is sometimes the case, the first part of the report is published as Part I, the second as Part II, etc. The desirability of this presentation as compared with the "Convention Report" method, is self-evident, the chief advantage being that the compilation of important data is placed in the hands of members at the earliest possible moment.

Because past experience has proved the futility of attempting to keep an accurate report mailing list of individual names, reports when published have been mailed to each member company with a sticker on the cover stating that the report is for the attention of the department head most concerned; or the chief executive, in cases of Special, General and Public Relations Section committee reports. Under the practise being inaugurated with this administrative year the reports will be mailed to member companies with a sticker directing the report to the company's Accounting, Engineering, or Commercial chief executive, and in case of Special, General and Public Relations Committee reports, to the company's chief executive officer. The color of the sticker in each case corresponds to the color given the various national sections by the Secretary's office at Headquarters; i.e., blue for accounting; pink, engineering; red, commercial; yellow, public relations; green, special and general committees.

The practical and useful information on all phases of the electric light and power industry made available in N.E.L.A. committee reports offers the men and women of the industry a most valuable service which many are learning to use for their own benefit and that of their company.

During the past administrative year, there were published 75 committee reports, totalling more than 2000 printed pages, and dealing with accounting, commercial, engineering, public relations and many other subjects. The distribution to member companies only, exclusive of standing and other orders, amounted to more than 250,000 copies.

Believing that the value of this work in the final analyses must be measured by the importance of these reports to the individual men and women in the industry, a recent request was made by the Executive Secretary of the Southeastern Division, C. M. Kilian, for individual comment on their value, which brought a gratifying response. Abstracts from a few of the replies are appended. There were many others which lack of space prevents reproducing here.

No doubt there are many employees and executives of member companies as well as others who may not be well acquainted with this phase of the Association's work, so it seems pertinent also to mention here a fact or two concerning the character of this service.

For the collection and assembly of information and data on company operating methods, practices, equipment and new developments, the various national committees of the Association without a doubt have at their command the best qualified men of the industry. The fact that member companies delegate to active participation in N.E.L.A. committee activities, the men and women in their organizations who have shown exceptional merit in their selected fields of endeavor, is indicative of the importance the industry attaches to this work. This collaboration of expert talent, representing as it does all sections of the country, assures a comprehensive portrayal of the latest trend and developments in specific fields of the industry, which is both accurate and authoritative.

Comments on N. E. L. A. Reports

All N. E. L. A. reports which have any bearing on electrical operations of our company are passed to the particular department head interested in the particular phase of work covered in the report. In reading these reports I frequently obtain ideas which are useful in our work. I make it a practice to write memorandums to the various department heads at the time of reading these reports, and while the ideas are fresh in my mind. We make it a point to read all reports which apply to our work, and in this way keep up with the latest practices in the industry.—M. ELDREDGE, *chief engineer*, Memphis Power & Light Company.

* * *

The operations of our company are scattered over the entire State with several main offices. Value has been received from a recent report through distributing the report among our field representatives. The report, in part, dealt with a problem that has been of much importance in the past year. It is believed that the report was of value in producing cooperation between employees and coordination of their efforts in their work on this particular problem.

Reports have been of value in that they have given other companies' experiences on general problems that we were working on.

They have also brought out practices of other companies that have indicated ways of improving the existing methods of handling certain work.—J. T. FOWLER, JR., Alabama Power Company.

* * *

It would be very hard to explain or to estimate the value and benefit that we have received from these splendid reports. I will assure you that they were read with very much interest and have been very beneficial to quite a number of our employees.—T. S. MURRAY, *new business manager*, Tide Water Power Company.

* * *

During the past year I have received a number of reports which the Association has issued. These reports have been interesting to me due to the fact that a large number of them have dealt with subjects and problems which have confronted us in our daily operation.

These reports are of value as they discuss the various methods employed by the different utilities in handling typical problems. Quite often when a new problem arises, I am able to refer to N. E. L. A. Reports and get some information on how other companies have handled the same situation. This history and experience data are often quite valuable.—R. F. PENMAN, *electrical engineer*, Knoxville Power & Light Company.

* * *

We have found the N. E. L. A. Reports very interesting and helpful to us in our work, as we have used copies received and duplicated orders for several of the various subjects discussed.—WILLIAM W. CARLTON, *supt., meter department*, Southern Cities Power Company.

* * *

The benefits derived from the N. E. L. A. Reports may be summarized as a large number of small benefits rather than a few large ones. The information contained in the reports is usually in such form that the higher grade operators can readily digest same and obtain ideas which may be applied practically in their every-day work. It is felt that the greatest benefit comes to the employees of member companies in the application of information and ideas obtained from the reports.—J. H. WHITE, *superintendent of power*, Florida Power & Light Company.

* * *

Reports received from the Association have been very interesting and also valuable in more ways than one. I very often refer to N. E. L. A. Reports for information concerning operating and technical problems.

They have served to bring about a better understanding of what others are doing in the public utilities field. Putting forth an effort to absorb the practical and technical points as represented in these reports has been a wonderful help to me in utility work; consequently I feel that these reports will serve in a valuable way to all utility employees who are interested in keeping up with the progress of the utility business.—E. M. LYNCH, *supt. of meters,* Florida Power Corp.

* * *

I don't know of any source where data, reports, etc., bearing on our industry may be obtained that can be considered as comparable with the N. E. L. A. publications. These reports necessarily cover a wide range, and some, of course, are more interesting than others to the individual—the interest usually being in direct proportion to one's activity in the particular phase of our business under discussion. I find that the serial reports issued by the various committees are not only informative but educational, in that they cover the intimate problems met with in the various branches of the utility business, and being prepared by men within the industry they retain a certain amount of that intangible thing called "personal touch" that keeps one interested and wanting to know what the next subject for discussion will be.—W. L. WOOTTON, *engineer,* Florida Power & Light Company.

* * *

We received many reports from the Association, all of which were very interesting and were read by almost every engineer member of this department, and they have been helpful in many ways because these reports have given us all, I think, a somewhat broader aspect of our daily endeavors than we would have had if we had not received them.—G. J. ROEWE, *chairman, Overhead-Underground Systems Committee,* Carolina Power & Light Company.

* * *

The various reports issued by the Association are practically always interesting, particularly so if they deal with subjects with which one is immediately concerned. The experiences and new installations covering the industry have been of value in solving some problems by pointing out ways of bettering efficiencies, or by preventing duplication of unsuccessful experiments, which would be the case if we were not kept advised of the efforts of others with the problems encountered in central station work. The work involved in preparing and submitting reports is more than compensated for by the helpful suggestions and exchange of ideas that this work brings about.—J. MARSHALL JOHNSON, *asst. supt., steam station,* Nashville Railway & Light Company.

* * *

I believe that the general dissemination of knowledge gained from the operation of various systems is of great value to all those concerned in that, by profiting from the experience of others, costly experimenting and changing of methods can be minimized. I hope that the Association will continue to publish these reports as heretofore, so that information obtained and conclusions reached may be passed out to those who are not actively engaged in working up the data for the reports.—J. COLEMAN JONES, *transmission engineer,* Florida Power & Light Company.

* * *

N. E. L. A. Reports of a general nature and applicable to other businesses besides light and power companies have been of value to us. We always look through every report, and if there is anything that we can use, it is kept. To be specific, last week the report on the "Suggesstion Systems" to be used in accident prevention was sent to our plant superintendent for consideration.—W. M. CLARK, Bessemer Galvanizing Works.

* * *

N. E. L. A. Committee Reports are of value in that we can pass on to various members of our organizations the opinions of committees or men who have specialized in some particular subject.

I think that their greatest value lies in their usefulness to the men who do not get an opportunity to attend conventions and committee meetings.—J. A. LONGLEY, The Tennessee Electric Power Company.

* * *

In these days of rapidly changing methods and conditions, if one is going to keep up with the procession, it is very essential to get the ideas of other people in the same line of work, who are meeting the same problems and have to devise new methods to meet certain emergencies. The Association Reports are the main source of these new ideas and methods, and are of real value to us.—L. H. CROWELL, *comptroller,* Columbus Electric & Power Company.

* * *

It is my personal opinion that some of the reports which have been published by the Association during the past eighteen months are the best references and educational bits of literature that it has been my good fortune to study.—HAROLD W. KING, *district manager,* Sangamo Electric Company.

* * *

I maintain in my office a file of N. E. L. A. Reports which are available to the various members of the organization, and every one of them has been of interest to somebody. They are valuable as reference and keep us up-to-date.

I hope you will continue your plan of sending these reports out, and that my name will remain on the mailing list.—E. F. McLAUGHLIN, General Electric Company.

* * *

I am pleased to answer your letter relative to the good that has been derived by myself and the Department from the reports which the Association has furnished us. Reports of this nature are always interesting, and always contain some thought of value: First, because of the thorough and concise manner in which they are presented; second, because they contain the important happenings, developments, and suggestions in which we are vitally interested; and third, because they keep us in touch with, and better enable us to work mutually with our sister companies in rendering a better service.

We appreciate very much the assistance received by way of the reports you have furnished.—L. N. WILSON, *Supt. of Meters,* Knoxville Power & Light Company.

* * *

I read with a great deal of interest all the reports of the N. E. L. A. and receive considerable information from them that can be used in our work here.—J. S. SUTHERLAND, *Asst. Mgr. Mdse. Sales Division,* Alabama Power Company.

* * *

I consider the reports of the Association as invaluable in the dissemination of information concerning the industry. Among the reports which have been received, I have been particularly interested in those dealing with market and industrial development.—F. J. DODD, JR., Georgia Power Company.

A Study of Merchandising Advertising

(*Continued from page* 708)

when it was believed that the expenditure would prove most profitable. When this work had been completed, it was found that the expenditures during the first two months of 1929, were to be made on advertising for the appliances shown in the following table:

JANUARY	FEBRUARY	
Heating Pads	Heating Pads	Refrigerators
Irons	Irons	Percolators
Hair Dryers	Hair Dryers	Toasters
Kitchen Units	Kitchen Units	Vacuum Cleaners
Lamps	Lamps	Waffle Irons
Ranges	Ranges	
Space Heaters	Sewing Machines	

A definite amount was allotted to each of these appliances for each month. The sum of these amounts in either month made up the amount of money available for planning that month's advertising. It was not expected that it would be possible to adhere to the exact amounts, but it was believed that the amounts for each appliance would clearly indicate to those who planned the advertising, the relative importance of the appliances to be advertised.

In actual practice, the expenditures were kept remarkably close to the sums set aside. The advertising given some appliances did not use the entire sum allowed, and in one case considerably more was spent than was planned. At the end of two months, a check-up showed that the total amount spent during the two months was within a very few dollars of the amount allowed by budget for those two months, and was under the budget, not over.*

AUTHOR'S NOTE: The above paper was written and submitted at a time when the budgeting plan had been in use for only two months. At the end of eight months, it is reported that the plan has worked with very little adjustment. Total actual expenditures have been less than the budget, and sales showed an increase.

John W. Lieb

JOHN WILLIAM LIEB, past president of the National Electric Light Association, senior vice-president of the New York Edison Company and a mechanical engineer of international experience and fame, died at his home, 30 Montgomery Circle, Beechwood Terrace, the night of Nov. 1. He was sixty-nine years old.

Mr. Lieb had been associated with the electrical industry from its beginning. For more than forty-eight years he had been connected with the various enterprises that grew out of the invention of the incandescent lamp of Thomas A. Edison, and it was Mr. Lieb who aided the inventor in establishing and proving the practicability of the first electric station in the United States, making it possible for every home and factory to use power from a central plant.

Born in Newark, N. J., Mr. Lieb was graduated from Stevens Institute of Technology in 1880, immediately after becoming a draftsman for the Brush Electric Company in Cleveland. The following year saw him in New York doing the same work for the Edison Electric Light Company, where he worked on the plans for the electrical equipment of the Pearl Street Station, the pioneer central plant for the distribution of light and power.

With the plans completed, Mr. Lieb was transferred to the Edison Testing Works in Goerck Street, where, in the experimental and testing departments, he did research work under the direction of Mr. Edison, and early in 1882 he was given charge of the installation of the "jumbo" dynamos and equipment of the Pearl Street Station. Regular service from the plant was inaugurated in September, 1882, and Mr. Lieb was appointed first electrician of the Edison Electric Illuminating Company of New York.

So precise and thorough had been his work that Mr. Edison chose him to go to Milan, Italy, to install the Milan Edison Station. Not only did he fulfill the appointed task, but, as an additional job, he built a trolley system in Milan. For his work in introducing electricity in Italy the government made him a Knight Commander of the Royal Order of the Crown of Italy, in which he later was promoted to a Grand Officer. He was also an officer of the French Legion of Honor.

After he had been an executive of an electrical company in Italy, Mr. Lieb returned to the United States in 1894, becoming an officer of the Edison Electric Illuminating Company of New York, with which he remained until the company was absorbed by the New York Edison Company in 1901. In the latter company he became successively associated general manager, general manager, vice-president, vice-president and general manager, and finally senior vice-president, which he had been for the last two years.

Mr. Lieb was a pioneer also in the advancement of technical education, and he participated in the work of many technical societies as well as writing extensively on electrical subjects and lecturing at universities and institutes. He was accredited with having the largest library and collection of documents dealing with Leonardo da Vinci, and for many years he had been engaged in investigating and translating sketches and texts covering the researches of da Vinci in natural science and engineering, these researches being transmitted to Italy through his membership in the "Raccolta" of Milan, of which Mr. Lieb was a correspondent.

In 1923, Mr. Lieb won the Edison Medal for his work in the development and operation of electric central stations. During the war he was chairman of the National Committee on Gas and Electric Service. He held offices and directorships in the New York Edison Company, the Yonkers Electric Light and Power Company, the United Electric Light and Power Company, the New York and Queens Electric Light and Power Company, the International Power Securities Corporation, the Brush Electric Illuminating Company, the Empire City Subway Company, and a number of other organizations. He was president and chairman of the board of the Electrical Testing Laboratories and vice-president of the Electric Light and Power Installation Corporation.

He served in international matters as: chairman, Section "E" International Electrical Congress, St. Louis, 1904; Representative U. S. Department of State at International Railroad Congress, Rome, 1922; member, U. S. Executive Committee, World Power Conference, London, 1924; U. S. Delegate, International Congress on Illumination, Geneva, 1924; chairman, Reception Committee, International Electrotechnical commission Meeting, New York, 1926; vice-president, International Association of Producers and Distributors of Electrical Energy, Paris, 1928; executive chairman, American Organization Committee, World Engineering Congress, Tokyo, Japan, 1929.

Mr. Lieb was a former president of the National Electric Light Association, the Edison Pioneers, the American Institute of Electrical Engineers, the Association of Edison Illuminating Companies, and the New York Electrical Society, and a former vice-president of the American Society of Electric Engineers. He was a fellow of the American Academy of Sciences and was a member of numerous other technical societies and associations. In 1921 he received the honorary degree of Doctor of Engineering from Stevens Institute.

His clubs were the Engineers, Delta Tau Delta and the Westchester Biltmore Country.

In 1886, Mr. Lieb married Miss Minnie F. Engler, of New York, who survives, with two daughters and a son. They are the Misses Julia C. and Minnie E. Lieb, and Adolph W. Lieb. A brother, Oscar J. Lieb, of Newark, and two sisters, Mrs. Charles O. Baldwin and Miss Anna Lieb, both of Caldwell, N. J., also survive.

Funeral services were held at his home on the afternoon of November 3, following the arrival of a special train from New York, and the remains were laid to rest in Kensico Cemetery.

Mr. Lieb was exceedingly active in the work of the National Electric Light Association. In addition to having been president during 1917-1918, he had served on and headed many of the important committees of the Association.

Matthew S. Sloan, president of the Association, and of the New York Edison Company, on the death of Mr. Lieb made the following statement:

"The death of John W. Lieb is a very great loss to the electric industry. A pioneer in the central station field, he gave to the industry the benefit of his sound technical knowledge and great experience through a vast amount of committee work, writing and lecturing. He labored unceasingly in improving the technique of electricity supply and was largely responsible for the rapid development and high standards of modern electric service, not alone in the companies with which he was connected, but in the entire industry. He was an idealist who could make his ideals work. His ability and high character won the respect and the affection of all who were associated with him in his widespread interests and activities."

David L. Huntington

DAVID LYNDE HUNTINGTON, president of the Washington Water Power Company, Spokane, since 1910, and prominently identified with the electrical development of the Northwest, died at his home in that city, September 27. He had been confined to his home for the past two years, although during the greater part of that time he was able to devote some attention to company affairs.

Mr. Huntington was an important factor in the growth of the Spokane utility and it was largely through his vision and guidance, in association with the late Henry M. Richards, the preceding president, that the company has reached its present position. The last big undertaking of Mr. Huntington as active head of the Washington Water Power Company was the building of the Chelan hydroelectric plant, in connection with which project he made several trips to New York and personally supervised the details of the purchase of the site, the award of contracts and the financial program formulated to see the enterprise through. Although he became ill before the work was completed he kept in touch with its progress, and it was he who pressed the electric button from his sickroom that placed the first unit in service.

Mr. Huntington entered the employ of the Washington Water Power Company in the capacity of treasurer in 1894. He was made assistant secretary in 1895, in less than a year became general manager, and in 1903 was appointed second vice-president and general manager. It was in 1910 that he assumed his executive duties as active president of the company and affiliated properties. In addition he had been president of the Spokane United Railways since that company was formed July 1, 1922.

Mr. Huntington was born in New London, Conn., and received his education in the public schools of Washington, D. C., and at Yale University. After leaving Yale he joined the Thomson-Houston Electric Company, Lynn, Mass., and following the organization of the General Electric Company, he was sent to the Philadelphia district, where he engaged in various kinds of work ranging from the selling of appliances to the building of pole lines and power plants. He resigned to become treasurer of the Washington Water Power Company. He was active in the National Electric Light Association and other engineering societies and was a fellow of the American Institute of Electrical Engineers.

Interconnection to the Rescue of Georgia City

INDUSTRIALS in Augusta, Ga., were seriously threatened during the latter part of September by high waters of the Savannah river which damaged the levee and the city-owned canal, from which the industries obtained mechanical power. The situation has been saved and prospects for the future brightened by electrification of these industries, as set forth in the *Augusta Chronicle,* Oct. 5:

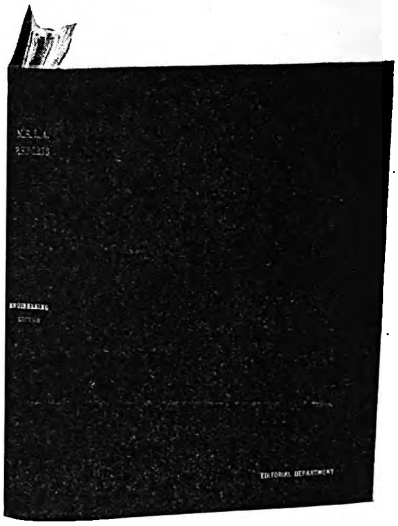
"One of the most gratifying achievements of modern times finds its exemplification in the progress evinced in Augusta at this time. Just twenty-one years ago the Augusta canal was washed out similar to the catastrophe just recorded. However, the damage at that time was not quite as great as in the present instance. At that time it took two or three months, as we recall it, to get the mills back to work. However, machinery and modern methods may make the mending quicker at this time.

"When the washout was reported last Saturday there was a sort of mournful spirit abroad in the city. Thousands of operatives faced months of idleness, or weeks at best. This was considered a deplorable condition, accentuated by winter coming along, with Christmas on ahead. At no time could mill workers afford to be idle, but certainly no more ill-timed period could have been selected.

"But progress has written a new page in Augusta's history. The officials of the John P. King Manufacturing Company, Friday signed up for the electrification of the big plant. Saturday a carload of motors were rolling into Augusta from the Georgia Power Company and yesterday the wheels of the big industrial enterprises were turning and the employees were back at work. The achievement is perhaps without parallel in American industrial annals. More than that, the Sibley Mills and the Augusta Factory also completed plans for electrification last Saturday and almost all the motors are in with others being hauled in and being installed so that the plants will be going full force by Monday or Tuesday, at latest. The Globe and Clark Mills will also complete today, or Monday, so that they will be in full operation not later than Tuesday. The Enterprise Mill, one of the largest in the city, has already been electrified.

"The record would have been impossible without superpower. The hydro-electric plant at Stevens creek is still many feet under water, but Augusta has known no interruption of light and power service. The big oil mills, lumber plants and other industries will be turning just as quickly as they can be gotten in shape, with the debris cleared up, for power is available at the switch. If it had not been for superpower Augusta would not have had any street lights and no power, and street cars would have had to cease operation. Just as the situation stood nobody knew there was any hampering of power. The auxiliary steam plant here could furnish only enough current to barely light the residences and possibly provide a little emergency current.

"Georgia's harnessed waterpower, properly distributed, brought needed aid to Augusta. It will give uninterrupted employment to Augusta's factory workers and to all others dependent upon power for a livelihood. Even the Georgia Iron Works will be electrified by Tuesday. All Augusta goes back to work by Monday, at latest, and the farmers, too, will be in action, with roads open to traffic. Business will feel the effects of recuperation within a few days and Augusta faces the future with bright prospects of going forward and doing better than ever. The impetus of determination to carry on will drive us further forward, even under the unfavorable circumstances, than we could ever have gone under lethargic conditions."



Binders for N. E. L. A. Publications

The Association offers for sale handsome, leatherette binders for those of its publications that appear periodically or in series.
The prices of these binders are as follows:

N. E. L. A. Bulletin	1.75
Rate Research	1.25
For Reports:	
Engineering Reports (Large size binder)	1.75
Engineering Reports	1.25
Accounting Reports	1.25
Commercial Reports	1.25
Public Relations Reports	1.25
General and Special Committees	1.25
Weekly Information Letter	1.25
Electrical News Items	1.25
Statistical Reports	1.25
Public Opinion	1.25
(For new series beginning Jan. 1, 1930)	
Informational Booklets	1.25

Service Suggestions

NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman*, Public Service Co. of Northern Illinois, Chicago, Ill.
To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 77 November, 1929

Getting the Employees' Help

IT has been proved that an uninterrupted supply of electricity at adequate pressure does not spell good service to the customer. Efficient machinery, well planned distribution systems, fine buildings, and liberal company policies mean little if the contact between employees and customers is not pleasant, exact and courteous.

Many methods of impressing the men and women of public utility organizations with the importance of the part they play have been tried. Suggestions along this line are always welcome. The Customers' Relation's Committee is constantly reviewing material prepared by member companies. The Public Relations Department of the Philadelphia Electric Company has recently prepared a booklet entitled "Sprinting for Super-Service," which is addressed to its employees, and should do much to develop a proper attitude in the minds of the personnel. This booklet is reproduced, with most of its illustrations, by special permission of the Philadelphia Electric Company.

Sprinting For Super-Service

Pleasant reports have been coming to our ears. Comments from customers tell us our employees rank among the most courteous they have ever met in a utilities company. They tell us you smile, that you meet situations with cheery graciousness, that you are patient, kindly.

A Twofold Purpose

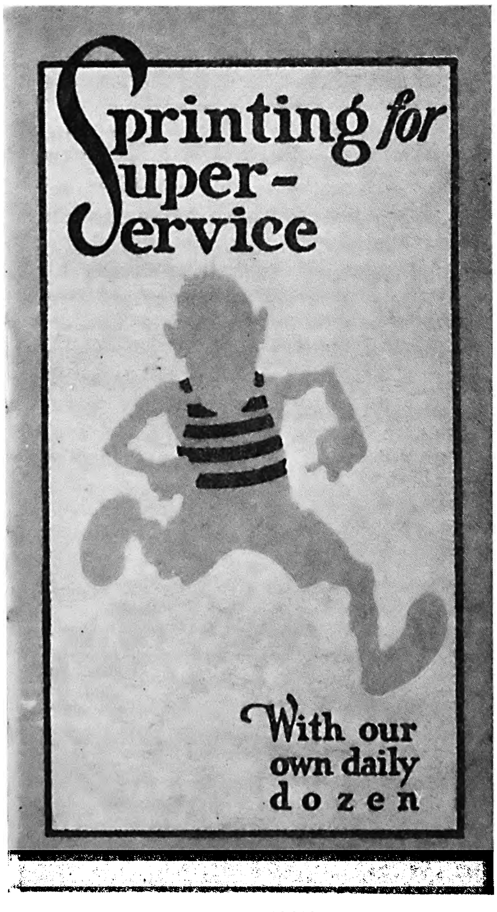
The object, then, of this friendly talk within the walls of a little book is two-fold:

1. To say that your company appreciates your fine spirit and efforts—this striving for super-service.
2. To preserve the fine standards of courtesy already won and to try for ever greater records.

Every big industry takes special pride in one phase of its business. Here is a railroad which wants to be known for its vast trackage—endless miles of glistening steel ribbons that make giant crisscrosses over the face of America. Here is a steel plant that wants more smokestacks than any other plant in the world sending great gray spirals into the sky.

Our Pride in Super-Service

We want our steel to glisten, too . . . but our great pride is to send the name of your company far and wide for its spirit of personal service. Will you, as a keen, spirited force, help us to achieve this goal?



First of all, let's stand a little closer and exchange ideas on this big subject of courtesy as it pertains to our business. For, actually, it is an exchange of ideas with surely the greater number being contributed by you.

There is no fine distinguished act of courteous service which was not first the thought of some employee rising to the need of some customer.

The Employee is the Company

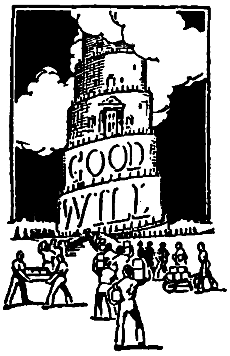
Perhaps it is an employee whose work is such that he never sees the sight of a customer during all his working hours; but who, at his lodge, his civic or country club, at the corner drug store in the evening, has remembered HE IS THE COMPANY to everyone he knows, and never failed to act loyally in that capacity. For here is a strange thing: Most merchants close their customer day when they turn the key in the shop, but no member of our force can step out in the evening and hail a passerby without encountering a customer of his company.

The Unusual Call to Service

A young man in the maintenance department strolled around to the neighborhood drug store for his can of tobacco. While he was there the lights suddenly went out. The proprietor remarked that this was the third time within a week that this had happened.

Naturally, he started to blame the company. But this particular young man noticed that the lights in adjoining properties were burning and suggested that the trouble was probably due to too small a fuse. An examination showed this to be so. A service maintenance man was summoned. The lights were shining brightly in no time.

So this code belongs to you all—not alone to service employees, salesmen, saleswomen, home service representatives, meter men, our telephone family and the rest, but to our force of nine thousand whose work weaves into the great pattern of service. It embodies ideals and practices you have set up. Although we are, of necessity, the spokesmen, you who have striven cheerfully and intelligently are the true authors of this little book, the object of which is perfection of service.



Brick by brick . . . , goes this tower

Courtesy is a Unit of Exchange

What, then, is courtesy? And, why?

Courtesy is the coin with which we buy the good-will, confidence, approval and support of our customers, the public. Without these no business can hope to succeed permanently.

Many people imagine good-will to be a big intangible thing which a company somehow magically has or has not. Good-will is never an accident. When a company possesses it there are hundreds, thousands of individual reasons. They are the individual acts of employees. Good-will is a tower of strength that can be as definitely built as the newest gold-domed skyscraper. It can be built only by employees. Every single helpful act makes the tower rise higher. Every disinterested act throws away a chance to build!

Perfect customer contact, as analyzed by a sprightly young lady employee, is divided into three parts:

THE BEGINNING
THE MIDDLE
THE END

The beginning is the most important part. Its key word is welcome. A smile at the first approach of the customer, or a kindly inquiry is worth fifty smiles and interested questions later. Who has not had the experience, at some sales counter or other, of having to coax some high-hat saleslady into good humor?

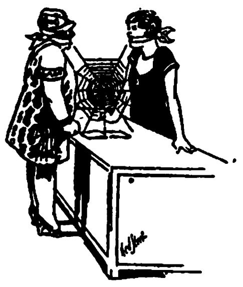
Sales in Personality

Not only does the first fifty seconds of receiving a customer set the whole tone of the contact. It sells your personality. So be yourself from the start! Why hide beneath a glum exterior? The prospector will mine for gold. But not so the average human being. He will take you at your face value. Be pleasant.

Dropping in on the high-hat saleslady

Wait on the customer as quickly as possible. "I'll be with you in a minute!" is a helpful little phrase.

Above all, in finishing the business with one customer do not adjust your blanks in so leisurely a fashion that the waiting visitor imagines you're about to play solitaire. The meeting of the employee and customer over the service desk should never turn into an endurance contest to see who will speak first. The unfailingly right thing is for the employee never to fail to put in a polite query first.

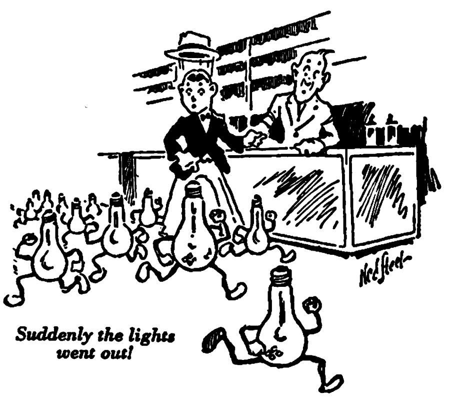


The endurance contest . . who'll speak first?

Service the Watchword

If welcome is the keyword for the beginning of the successful customer contact, SERVICE is the watchword for the middle. From the time the customer steps into the office to inquire about a contract until he is no longer on the line he deserves the best service possible. We must continually remind ourselves service is not something we are giving him. It is something he pays for, and, because of that alone, he is entitled to the best.

In the first place, remember we are a monopoly, regulated as to rates and service and financial returns by the Public Service Commission. It is not practical or economical for two companies to furnish gas or electric light in the same communities. In their ordinary business affairs, if customers are dissatisfied they can take their business elsewhere, but a public utility customer cannot go to another company, and if there were no other reason, the obligation of the utility company to give good service would be the greater.



Suddenly the lights went out!

"He acts as though he were doing you a favor," is, alas, still the label tacked to the wrong-attitude type of utilities employee. We are sure you realize your company not only does not feel it is doing its customers a favor to sell them electric current and good service with it. . . . It KNOWS this. For, while it is true the displeased customer cannot walk out and take the business of lighting his home down the street to a rival concern, he can take his friendship, his loyalty, his good-will where he pleases.

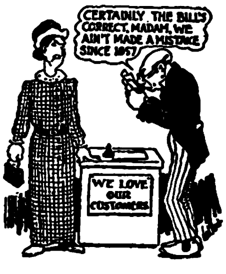
This is a far greater loss than if he were actually to say, "I don't care to do business with you folks any more," and go out the door.

Take a personal interest in your customer's problems or question. Play the host if it's the matter of a contract. If you can discover the gentleman's name, call him that—by all means. Make him feel that he is entering on a fine new friendly relationship; let him realize that everything will be done to serve him and his family and his home in their electrical or gas needs. Show this customer that your organization is striving to lead in the utilities field in the spirit of personal service.

Be Alert, Wide-Awake!

Be alert, wide-awake, thinking ahead for the newcomer.

Tell him the deposit is eventually returned to him with interest. Don't make him drag it out of you like pulling teeth. The expenses of life, no matter how small, interest us all.



CERTAINLY THE BILL'S CORRECT, MADAM, WE AIN'T MADE A MISTAKE SINCE 1857
WE LOVE OUR CUSTOMERS

Section II, Bylaw 3, The Maddening Act

Listen to complaints and criticisms and suggestions as well as to the usual business which you handle each day. Treat a customer's opinions with consideration.

Interpreting Company Policies

A personally interested employee has never answered a question about a certain practice or procedure of the company with a brief "It is the rule." Nothing is more maddening to any of us than to have someone calmly refuse to give us the reason for something. Most employees do know and give the fair reasons that lie back of rulings. If you

Just after a little information!

sincerely do not know, there's always the way of assuring the customer that there must surely be a good reason and you'll make it your business to find out. We make friends for the company when we try to interpret its policies in friendly fashion. Up rises that tower of good-will.

It is a mighty job feeding great communities with gas and electricity, and we who stand at our posts know it. But our business is complex and technical, it cannot be familiar to all. So if a complaint seems a little unreasonable, remember it does not seem so to the man or woman who is making it. For this reason be patient, tactful, considerate and helpful.

Be careful, for if you are careless in getting the right name and address, if you make promises that you are not sure can be kept, if in your desire to make a sale you overestimate or exaggerate, the whole ends of striving for super-service are defeated. If the name and address are incorrect, service is delayed, bills are missent, and an endless chain of trouble and inconvenience result. The customer is seriously put out. The company is perhaps irreparably wronged in the eyes of that customer—all because of the failure of someone who was tired, of someone whose mind was perhaps on something else.

Failure to listen and note carefully makes it necessary to do something twice when CARE would have required it to be done only once.

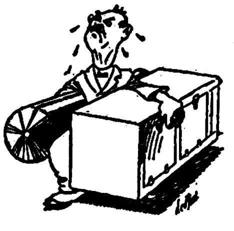
A Lesson in Mother's Maxim

Always keep a promise!

Here is an instance where fate and the promise-maker played the same unhappy prank on the same woman twice. Shortly before the Christmas rush she bought a lamp. She explained very carefully that it was a Christmas gift and that it MUST be delivered the day before Christmas day. This was promised. The delivery was made the day after Christmas day. . . . Six months later the same customer bought a daylight lamp for her kitchen. Having in mind her previous disappointment, she was most careful about settling on the exact day the light should be sent and installed. The promise was made.

Two days after the failure of the lamp to arrive she wrote a letter outlining these two unfortunate experiences.

Somewhere between the sale and the delivery of these two articles someone had failed to do the job. " 'I'll do it myself,' said the little Red Hen," is an adage many of us have heard our mothers quote when someone in the household failed on a particular task entrusted. It is a homely little maxim that has its place in the business world as well as in mother's store of wisdom. We can't put refrigerators and gas water heaters under our arm and cheerfully lug them to customers. But we can all keep a weather eye on our given word.



If we could only put 'em under our arm!

But most of all these two hapless experiences which befell the same customer go to show that while the work of thousands of our employees may not have directly to do with the customer, it has a very direct bearing. Their work is an important link in the chain of service and unless it is done with a sense of its special relations to super-service there can be no such aim in our organization. Unseen employees may surely be called the guardians of our promises.

No member of our force with a sense of his responsibility has ever fumed or grumbled before customers when the pressure of work around his desk or counter grew heavy. He has never exchanged remarks with fellow-employees about "this terrible rush," "all those people," and made similar tactless slips. This seems as rude as insulting guests in our homes.

That Gracious "No"

Clothes may make the man, but voice makes his personality. Two men and two women may say exactly the same words and create two entirely different impressions—one favorable, the other unfavorable. The difference is that one's voice was curt, lifeless, disagreeable; the other's was pleasant, animated, winning. Occasionally, some great man in speaking of his life will say one of the first great lessons he learned was how to say "No." Yet a greater man still will always top him by saying his first great lesson was how to say "No" graciously. Learn to say No graciously. If you cannot grant the request of a customer BE SORRY. NEVER BE GLAD.

Pleasing Appearance Helpful

Clothes are important in facing the world—and our customers. Take pride in your personal appearance — for it wins battles for us and those of us who come in direct contact with the public should be sure that our clothes are neat and clean and brushed, our finger nails and hands well kept

Learning to say it graciously

A DAILY DOZEN FOR COURTESY

1

Welcome the customer. Not with a brass band. Friendliness is the music of the human parade.

2

Compete to make the service desks and sales floor as cheery as last Sunday night's pick-up supper.

3

On your toes! *Exercise* personal interest in your customer's problem.

4

Exhale carelessness, inattention and arguments!

5

Inhale pep, alertness and glad-to-help-you, Mr. Jones!

Stop and listen—to complaints, criticisms and all suggestions. Many a man is sitting on the top of the world all because he was a good listener.

7

Smile. It will pave the way for amicable adjustment of a complaint, for the sale of appliances and a place in the hearts of your fellow-men.

8

Try this one: use your good judgment. Judgment, like knees, gets creaky when out of service.

9

Now give your heart a workout. Say "no" with regret. If you can't grant the request of a customer, be SORRY. Never be GLAD.

10

Be YOUR COMPANY—at the service desk, at the meter, on the stairway and in the hall. As far as the world is concerned, you are the President and the Board of Directors.

11

Be YOURSELF. Why hide beneath a glum exterior? The prospector will mine for gold. But not so the average human being.

12

Play the game. It is your turn today—mine tomorrow. "Would you have your name written in the hearts of men? Then serve them gladly."

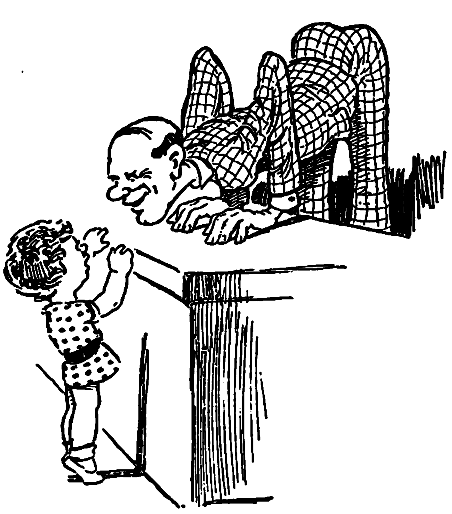
and our general appearance pleasing. We feel and act as we look.

If Welcome is the keyword for the beginning of customer contact, Service the watchword for the middle, then Happy-to-Help-You-Any-Time is the spirit of the close. Much has been written about first impressions; little about last impressions. Yet we all know the pleasant parting sends us forth with a lift, putting us on good terms with all the world.

But Beginning, Middle or End, here is one inviolable mandate which no earnest, kindly member of our organization has ever chosen to violate:

Treat every customer with the same kindness and deference, irrespective of the sex, the color or the race. See that the smallest and the poorest customer receives the same prompt and interested treatment that the largest and the most important gets.

Public relations are nothing more than human relations, friendly human understanding. We deal with men and women like ourselves. If we can remember that they are after all just neighbors and it is just as important to have good relations with them as next-door neighbors, we shall be doing the fine thing for the community and for our company.



Taking an interest in the smallest customer

Aim at Service! . . . Is it worth while?

Wrote Angelo Patri, the teacher-philosopher:

"The world goes forward on the hands of workers, but it is proved among us that it cannot go far on efficiency alone. Into each bit of labor must go some little of the magic of service. Would you have your name written in the hearts of men? Then serve them gladly . . . it is not enough to do the job well. It is not sufficient to meet obligations promptly and justly. The spirit of service must breathe life into the work of our hands, or it perishes—and we along with it.

Additional Copies?

INVESTIGATION shows that only a comparatively small number of the men and women of the light and power industry who are interested in the subjects covered by Service Suggestions receive them. To meet the situation, Service Suggestions are reproduced in loose leaf form. Copies may be ordered direct from the office of the chairman. A charge of five cents is made to cover the cost of reproduction.

Any desired number of copies of an issue may be ordered or a standing order can be placed for a specified number of additional copies each month. Standing orders may be placed on an annual basis to save the annoyance of remitting small sums each month.

The subjects covered in recent issues were:

63—Courtesy Letters.
64—Tree Trimming from the Public's Viewpoint.
65—The Telephone as a Service Medium.
66—Handling Requests for Discount Allowances.
67—Informing our Customers about our Business.
68—Training Employees in Customer Relations.
69—Records that Speed Service.
70—Employee and Consumer.
71—Correspondence for Good-Will.
72—Teaching Customers to Read Their Meters.
73—Mechanics of Correspondence.
74—The Bill Jones Idea.
75—Active meters in Vacant Premises.
76—"Pay Bills Here."

Electrical Research Statistics

November, 1929

Issued Monthly by Statistical Research Department of the National Electric Light Association
420 Lexington Ave., New York, N. Y.

H. A. Snow, *Chairman, Statistics Committee, Accounting National Section*
Wm. M. Carpenter, *Economist*
H. S. Bennion, *Director of Engineering, N. E. L. A.*
Merle Rainey, *Statistician*

The National Electric Light Association, a voluntary organization of companies and individuals affiliated with or interested in the electric light and power industry, organized to advance the art and science of the production, distribution, and use of electrical energy for public service.

The Association maintains a Statistical Research organization which collects, interprets, and makes available basic statistical information on the electric light and power industry. The publications and services of this department are available to all those interested, on request.

Current Statistics of the Electric Light and Power Industry

(*As of August* 31, 1929)

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 86 per cent of the industry.

	JULY		Per Cent Increase	AUGUST		Per Cent Increase
DURING MONTHS OF JULY AND AUGUST	1929	1928		1929	1928	
*Kw-hr. generated (net)	7,534,129,000	6,664,443,000	+13.1	7,769,016,000	7,029,816,000	+10.5
Add—energy imported from Canada and purchased from outside the Electric Light & Power Industry	178,710,000	195,000,000	− 8.4	209,000,000	209,000,000	
Less—energy used in company departments	191,000,000	192,000,000	− 0.5	190,000,000	209,000,000	− 9.1
Total energy for distribution (kw-hr.)	7,521,839,000	6,667,443,000	+12.8	7,788,016,000	7,029,816,000	+10.7
Sales of energy in kw-hr. for:						
Farm service (not involving irrigation)**	7,264,000			8,726,000		
Farm service (involving irrigation)**	174,997,000			194,376,000

Basic Information on the Electric Light and Power Industry

As of August 31, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the BULLETIN.

1. Value of plant and equipment (estimated)	$10,400,000,000*
2. Total generating capacity in kw	28,635,000
Steam	20,746,000
Waterpower	7,577,000
Internal combustion	312,000
3. Total number of customers served	23,761,000
Farm customers (as reported by 174 companies only)**	(240,259)
Domestic customers	19,569,000
Commercial customers—	
Small light and power	3,606,000
Large light and power	552,000
Others	34,000
4. Population in electrically lighted homes	82,200,000
5. Percentage of homes which are served with electricity	67
6. Miles of transmission lines (11,000 volts and above) (circuit miles)	158,000*

*Subject to revision. **Included below.

Operations of the Electric Light and Power Industry During August, 1929

THE statistical summary of the distribution of electricity during the month of August shows only a slight decline in the high level of industry and trade which has prevailed since early in the year. Since Jan. 1 total sales of large industrial power were 30,100,000,000 Kw-hr., an increase of 3,671,000,000 Kw-hr., or nearly 14 per cent, over the corresponding period last year. A further shrinkage in the production of hydro-electric energy is noted and (unless a decided change in climatic conditions takes place) for the first time since 1921, water power production will, during 1929, undoubtedly be smaller than it was during the previous year in spite of a large increase in the demand for electricity. During the first eight months of 1929, the output of water power plants, as reported by the United States Geological Survey, had increased by only two per cent over the first eight months of 1928, while the production of energy by fuel-using plants had grown by 18½ per cent. To a very large extent this has been the result of the prolonged drought throughout the Northern part of the United States, which has had serious results upon the agricultural outlook of many areas.

Seasonal Swings in the Average Price of Electricity

The average revenue per Kw-hr. sold to consumers is readily obtainable from the published monthly table of current statistics. There is a regular seasonal variation in the monthly average figures, beginning with a high point in December (when the proportion of lighting service in the grand total of sales is at its maximum) and ending with a low point in August (when the proportion of lighting service is at a minimum and the requirements for irrigation pumping are usually at their peak. Inasmuch as the current series of statistics has thus far been published only for the months of declining averages, it is entirely possible that some erroneous conclusions have been drawn as to an extraordinarily rapid fall in average revenues from 2.78 cents per Kw-hr. in January to 2.37 cents in August.

The course of sales, revenues and average prices of electricity sold to all consumers is shown in the diagram, where the solid line represents actual figures for each month and the dotted line the average for the twelve months period. While subject to a very decided seasonal fluctuation, there is a downward trend in the average revenue per Kw-hr. sold. For the year ending with December, 1928, it was 2.64 cents; for the year ending with August, 1929, it stood at 2.58 cents—a decrease of somewhat more than two per cent.

ENGINEERING SECTION

ALEX. D. BAILEY, *Chairman* H. S. BENNION, *Director of Engineering, N. E. L. A.*

Group Meetings of Engineering National Section Committees at Pittsburgh, October 1-3

Accident Prevention Committee Meeting

C. R. BEARDSLEY, *Chairman*

THE central thought of the October, 1929, Pittsburgh meeting of the Accident Prevention Committee was the responsibility of the Accident Prevention Chairmen of the Geographic Divisions. A meeting of these chairmen, who are representatives of their Divisions to the main committee, was attended by men from the following Divisions: East Central Division, Eastern Division, Southeastern Division, New England Division, Southwestern Division, Northwestern Division, Pacific Coast Division.

It is not sufficient for the Divisions to hold rallies of employees and foremen. It should be the aim of each Division to secure active effort in every member company property. Obviously the key to such activity is the executive head of each property. One Division has been particularly successful through the forceful but diplomatic efforts of its Chairman directed personally to executives of his Division. The greatest reduction of accident rate in any division has been achieved by this Geographic Division.

A very encouraging feature of the meeting was the very evident increase in interest in accident prevention on the part of other committees of the Engineering National Section and the appointment of executives and operating engineers in charge of field forces to represent their companies on the Accident Prevention Committee.

Subcommittee Reports

While the majority of reports were of progress, one was in final form and was adopted, and the following deserve comment:

Construction—M. R. Sumner, Chairman. Report on safe practices in heavy construction work was reviewed, but adoption delayed in order to obtain comment from new members. Adoption scheduled for January meeting.

Insull Medal Awards—Wills Maclachlan, Chairman. The increase in effective resuscitation work is in evidence through the increase in awards.

Low Voltage Hazards—E. W. Gorry, Chairman. The use of "Common Sense" envelope stuffer was discussed. One company is sending out 350,000 of these to consumers.

High Voltage Testing—C. C. Steck, Chairman. A report started during 1928-29 year, was completed and adopted for publication.

Tree Pruning—James Hill, Jr., Chairman. A report will be re-edited and extended for review in January or March. The Davey Tree Expert Company and Nelson and Kuemmerling are cooperating with this committee.

Rubber Gloves—K. R. MacKinnon, Chairman. Interesting test developments were reported on the effects of ozone on gloves in higher voltage use. This matter has been referred to the Special Research Committee with recommendation for further tests.

New Undertakings

Jointly with Electrical Apparatus Committee a report will be prepared on Safety Locks. This report should be valuable. A report will be started with the aid of the Inductive Coordination Committee on the "Hazards of Private Communication Lines." For companies undertaking to install such facilities, the experiences of those which have private lines will be of value.

Information is being collected concerning the hazards that may be present in consumer vaults and premises where both company-owned and consumer-owned equipment is in closest adjacent physical relation.

Future Meetings

The remaining meetings will be:

January—Place to be announced;
March—Edgewater Beach Hotel, Chicago;
June—During Annual Convention, San Francisco.

Engineering Research Committee Meeting

C. F. HIRSHFELD, *Chairman*

AT the meeting on October 1, at Pittsburgh, of this recently organized committee, the chairman outlined what the Committee expects to accomplish in its work.

The scope of this Committee will be to do everything reasonably within its power (a) to foster research and (b) to make available to member companies the results being obtained from research. The Committee will interest itself in the whole field of research from pure science research at one end, to the roughest kind of applied science research on the other end. It will strive to foster pure science research in proper places and will undertake to interpret the results of such research in general language calculated to make these results understood by and useful to engineers and executives generally in the light and power industry. The National Executive Committee has approved the employment of a staff assistant at N.E.L.A. Headquarters to devote his time to the work confronting the Committee.

Ultimate expansion of the Committee is possible so as to spread its work outside the scope strictly of the Engineering Section, into the field of the other Sections wherever research work is being or should be done. No doubt technical subcommittees will be organized later to deal with research in certain special fields; membership on these subcommittees will probably be drawn from research specialists in the member companies.

The Committee, and in particular the staff assistant, will try to keep in touch with all research work going on everywhere, to determine specifically what is being done, where and by whom. In each particular field calling for study, analyses will be made of the information that is needed as compared to the definite research work being done to get this information, and an effort will be made to eliminate any unprofitable duplication and to enlist and direct efforts of research organizations to undertake research covering those parts of the whole problem which are not being covered by the existing studies.

The Committee will have four main duties: (a) to contact with the laboratories of schools, of endowed research institutions, of the government, of manufacturers, and of our own companies; (b) to advise on the order of merit of research projects to be undertaken by the National Electric Light Association itself; (c) to act as an advisor and perhaps umpire on joint research projects between manufacturers and operators; (d) to stand ready to advise our member of the Committee which is acting as trustees of the National Pure Science Research Fund, particularly with a view of pointing out what pure science research is needed in the further development of the electrical industry.

At present about $200,000,000 is being spent annually on applied science research, $70,000,000 by governmental bodies and $130,000,000 by industry itself. An almost negligible sum is being spent on pure science research which furnishes the raw materials for applied science research. The Pure Science Research Fund was advocated by Mr. Hoover to improve this situation in order that the raw material for industry may be produced now as against future needs. The fund was planned on the basis of expending $2,000,000 per year for a period of 10 years.

Electrical Apparatus Committee Meetings

R. A. Hentz, *Chairman*

THE Electrical Apparatus Committee held its first meetings of the year in Pittsburgh on October 2 and 3, in conjunction with the Group Meetings of the Engineering National Section. Attendance at the Electrical Apparatus Committee meetings totaled 114. The following paragraphs briefly outline some of the more important discussions which took place:

Oil Circuit Breakers

Several new developments in connection with circuit breakers attracted much interest at the meeting. Representatives of the Philadelphia Electric Company and the General Electric Company discussed operating experience indicating the need for high speed switching and described recent tests on a 220-kv. high-speed oil circuit breaker on the Philadelphia Electric Company system. In this breaker, very high operating speeds were obtained. A representative of the Westinghouse company reported on new developments of his company in connection with high-speed switchings at both low and high voltages. Interesting figures were brought out with regard to the necessity of high-speed switching to avoid out-of-step conditions in generating plants. Judging from the reports at the Pittsburgh meeting, breakers are now available which will clear a fault in 6 to 10 cycles compared with 25 to 40 cycles heretofore. The discussion of switching at high voltages probably aroused more interest than any other topic discussed, since the subject of oil circuit breakers affects every operating company regardless of location or size.

The pioneer work done by the Association of Edison Illuminating Companies in concentrating attention on the deficiencies in previous types of oil circuit breakers as to design, construction, and maintenance has been summarized by the Protective Equipment Subcommittee of the Electrical Apparatus Committee and has been presented to all Apparatus Committee members in the minutes of the Pittsburgh meeting. This review of the 1929 A.E.I.C. Report should prove of interest to all electrical men and member companies.

Recent successful experiments with new types of non-oil-throwing circuit breakers for 15 kv. and below and 5000 to 10,000 amperes rupturing capacity have led to the suggestion that these breakers could be used more widely if their merits were full appreciated. Such a move would tend toward standardization.

The work of the Electrical Apparatus Committee in standardizing practice and definitions for trip free devices on oil circuit breakers has been practically completed and the National Electrical Manufacturers Association has adopted definitions which are satisfactory to the N.E.L.A.

The Committee on Preferred System Voltages presented a progress report stating that oil circuit breakers rated in accordance with the new standard system voltages would be cataloged as standard equipment on and after March 1, 1930.

Power Transformers

The question of standardizing transformation angles between various voltages in use on power systems was discussed. In view of the increasing tendency toward interconnections between individual companies, it is highly desirable that for all power systems any one voltage will bear the same angular relation to any other voltage, a condition which will greatly facilitate the making of the interconnections. The importance of this matter was generally recognized and further study will be undertaken. One of the counsellors pointed out that if the Electrical Apparatus Committee could assist other committees in working out a standard of phase displacement and could expedite its adoption by even one year, it would probably save the industry an amount equal to the cost of all Engineering National Section meetings for several years. Several suggestions as to phase displacement were discussed.

Constant Current Transformers

The proposed A.I.E.E. standards for constant current transformers were discussed and did not seem to meet quite fully with the requirements of the various companies as regards to temperature rating conditions and proper capacity for light load operation. Considerable operating and design information was presented at the meeting.

Lightning Arresters

There was considerable interest in the matter of determining the efficiency of various lightning arresters, especially as concerns the virtues of the various types and makes and the possibility of determining if and when they operated during storms. It was pointed out that two large manufacturers were now cooperating on standard impulse waves for arrester tests. The need for such a standard wave was emphasized, so that different makes and types of arresters can be tested on a comparable basis.

Peterson Coil

The Protective Equipment Subcommittee has arranged through the courtesy of the Georgia Power Company to make available to the Apparatus Committee a report on the Peterson coil now installed on the 38-kv. system in north Georgia. The operating record of this coil during the 1929 lightning season is included as an appendix to the minutes of the meeting.

Fractional Horsepower Motors

It was reported that final agreement has been reached by appliance manufacturers and the light and power interests on the characteristics of single phase 110 volt motors of one-third horsepower and less. Most appliances are now equipped with motors of approved characteristics, and announcement was made that on Jan. 1, 1930, those not now so equipped will appear on the market with motors approved under this agreement.

Outdoor Substations

Quite a few topics connected with outdoor substations are on the program of the Station Design Subcommittee. A very valuable preliminary report on bus spacings and ground clearances was presented at the meeting. A comprehensive report on grounded vs. insulated operating platforms for outdoor switches was also submitted. Designers will be particularly interested in the proposed report on types of outdoor station structures.

Current Transformers

Data on improved designs of low ratio current transformers were presented for the first time, as was a new type of low voltage current transformer for industrial metering. The new type of low voltage transformer means a great saving to many companies in connection with service installations.

Several companies brought up the matter of additional information regarding performance of current transformers under high overload and short circuit conditions, as such information is necessary from both the safety and relay protection standpoints. Steps are being taken to secure data of this type from the manufacturers.

Control Cable

A proposed standard for colors for multi-conductor control cable has been prepared and is practically ready for recommendation as standard. It is believed that this proposed standard will result in larger stocks by the manufacturers and less special requirements by the consumers, which will mean better delivery and prices.

Interlocking

The Protective Equipment Subcommittee is preparing a report on all types of mechanical and electrical interlocking for switching equipment.

Power Stations

The electrical features of the new Deepwater Station, jointly owned by the American Gas and Electric Company and the United Gas Improvement Company, and the new Delray No. 3 plant of the Detroit Edison Co., were described in detail. A preliminary report was presented covering electrically-driven auxiliaries for steam generating stations.

Installation Rules

The Utilization Subcommittee is working on the preparation of standard or typical service installation rules, representing the best thought of many companies. The starting rules for large motors have been discussed at length and a few principles determined as essential.

The matter of arranging services and service connections to provide adequate supply to hospitals, theaters, hotels, and public buildings will be considered at future meetings. All companies realize their responsibility in providing adequate service to such institutions and are very much interested in ways and means of so doing.

Relay Handbook

The Electrical Apparatus Committee of the N.E.L.A. and the Protective Devices Committee of the A.I.E.E. are now engaged in revising the Relay Handbook, and an outline of the proposed procedure and personnel undertaking this revision was presented.

Future Meetings

It was announced that the next meeting of the Electrical Apparatus Committee would be held in New York City the week preceding the mid-winter meeting of the A.I.E.E., so that members residing at a distance could cover both meetings with one trip.

Hydraulic Power Committee Meeting

Byron E. White, *Chairman*

THE Hydraulic Power Committee held its regular fall meeting at Pittsburgh, on Monday, Sept. 30 and Tuesday, Oct. 1, preceded by an inspection trip on Sept. 28 and 29, to the Lake Lynn, W. Va., and Deep Creek, Md., plants of the West Penn Power Company and Associated Gas & Electric System, respectively. Forty-two persons attended the meeting at Pittsburgh, while 27 participated in the inspection trip, both of which are record numbers.

Draft Tube Tests

One report was approved for publication; namely, that of the Subcommittee on Draft Tube Tests, which comprises a considerable number of tests of draft tubes, which data will be published without comment save the necessary explanation to interpret the test data. This, it is felt, will be of great value to engineers who are confronted with the problems of draft tube design, and particularly those brought about by space limitations and the necessity to fit a special type of draft tube into cramped quarters.

Welded Penstocks

A considerable amount of discussion was had on the subject of welded penstocks, and many divergent views were expressed. With the sources of information revealed by this discussion, it is expected that the committee on that subject will be able to go forward with the production of a report for presentation at the committee's March meeting.

Discussion of the subject of fatigue of metal in penstocks also brought out much interesting information on this subject, which confirmed the desirability of the investigation being undertaken by the subcommittee on that subject. It is probable that this report will be ready for submission at the next meeting of the committee, in form for approval for publication.

Hydraulic Turbine Governors

The Subcommittee on Hydraulic Turbine Governors presented an interesting progress report which elicited considerable valuable discussion, the results of which indicate that this subcommittee also should be in a position to present a final report at the next meeting.

Forecasting Stream Flow

In connection with the subject of the forecasting of stream flow, which has occupied the attention of the committee from time to time, for the past five years, Abraham Streiff, hydraulic engineer, of Jackson, Mich., presented a very interesting discussion of his cyclic analysis of runoff, accompanied by lantern slides and blackboard sketches. His discussion was extremely clear and convincing, and will undoubtedly result in more widespread attempts to forecast stream flow, by the use of this method, or some modification of it. In the discussion which followed, other systems of forecasting which have some resemblance to that of Mr. Streiff, were also discussed. It is clearly evident that decided progress is being made in this abstruse and complicated subject, and that valuable results have been secured in the past, while there is very bright promise of even more worth while results to be secured in the future. The Hydraulic Power Committee would be glad to get in touch with any who are working in this field, and who have any variations which seem to have value.

Pitting of Water Wheels

The pitting of water wheels, and welding to correct this condition, received considerable attention. Certain bronzes have been developed which seem to offer possibility of largely overcoming, or at least correcting the condition of pitting after it has developed. The Subcommittee on Welding is gathering information, with the definite promise of submitting to the spring meeting a report for publication.

Fishways

J. E. Yates, of Portland, Ore., chairman of the Subcommittee on Fishways, made a most interesting report, outlining the very real progress made in connection with electric fish stops or screens, and futher projected experiments with fishways. Major H. S. Bennion announced to the committee, that its request for an appropriation from the association toward the carrying out of Mr. Yates' experiments, had been approved. The results of these experiments will have much to do with influencing the future of hydro-electric projects in the Northwest.

Dams

The Subcommittee on Dams made no report, but the Chairman of the Hydraulic Power Committee stated that it is undertaking the preparation of an outline of an investigation, which it is hoped will be undertaken with the object of clearing up much of the uncertainty with regard to construction of dams, and particularly of foundation conditions. This, it is hoped will be ready for submission at the ensuing meeting.

Automatic Hydro Plants

The Subcommittee on Automatic and Semi-Automatic Hydro Plants also submitted a most interesting report, which was outlined to the committee by Mr. Chester Lichtenberg. It was the consensus of opinion that this report summarizes the subject clearly and concisely, and it was voted to authorize it for publication, subject to like approval on the part of the Electrical Apparatus Committee.

Penstocks

The Penstock Subcommittee, whose report was presented to the spring meeting, reported that additional data promised at that time would be in hand within a few weeks, and that then the report would be forwarded for publication.

New Work

Under the heading of New Subcommittee Work, the most important suggestion was that of the economic coordination of steam and hydro plants. In connection with it, the desirability and even necessity for simplification and reduction of cost in hydro plants and their details, was very clearly brought out. A new subcommittee to investigate these matters was authorized, and a preliminary report is expected at the spring meeting.

Inspection Trip

The inspection trip preceding the meeting again proved the desirability of this feature, and its very definite value through the intimate personal contacts formed, and the detailed confidential information exchanged in an atmosphere of cordial friendliness. Those who participated were unanimous in the opinion that the inspection trip was of even more value to the individuals who participated in it than the more formal meeting of the committee. All are agreed that this feature should be continued.

In appraising the value of such an inspection trip, it is important to remember the fact that those who participated in them are specialists who are each familiar with some more or less particular branch of hydro-electric engineering, and that the free exchange of information between such men is essential to the most rapid development and progress in this field. This can best be brought about under the conditions obtained in an inspection trip, where men are free to make contact with one another without restraint, and are not required to devote their attention to any set subject.

All indications point to the growing influence of the Hydraulic Power Committee as the preeminent organization of hydraulic engineers in America, where the latest ideas and practices are informally and frankly discussed, thereby enabling them to be more promptly put into general use, than would be the case with a less intimate and more formal organization.

Inductive Coordination Committee Meetings

H. L. Wills, *Chairman*

The fall meeting of the Inductive Coordination Committee, Engineering National Section, N. E. L. A., was held in Pittsburgh, on Oct. 2 and 3, in conjunction with the meeting of other engineering committees. The meeting was attended by twenty-eight members of the committee and twenty-three visitors.

Current Cases

About a dozen current cases which had been brought to the attention of the committee since its last meeting were discussed in detail. The discussion of the current cases involved a presentation of the outstanding facts of each case, and a review of the solutions. This discussion of each case, assists in giving the members and visitors to the committee, information on the present trend of the solution of the various situations. A number of current cases are solved without any consideration beyond the Power Company engineer and the Telephone Company engineer immediately involved. This is a way of handling cases which the committee is attempting to foster by increased education of the Power Company engineers in the fundamentals of Inductive Coordination and the application of the Principles and Practices to every day field problems.

The major number of the current cases that require serious consideration at the present time relate to over-voltages induced into the communication circuits during time of faults on the paralleling power circuits. The Joint Development and Research work has developed means for handling practically any noise situations that arise.

J. O'R. Coleman, of N. E. L. A. Headquarters Staff, presented several lantern slides showing a new method which is being developed by one of the Project Committees to assist in predicting voltages on communication lines due to proposed power line construction. Any calculations of this character made at the present time, may contain large errors due to local geological conditions. It is the hope of the Project Committee that this new method will permit a correct determination of the necessary constants for the given location with comparatively simple and inexpensive tests.

Radio

The work being done in connection with Radio Interference complaints was reviewed by the committee. The introduction of the A. C. receiving set has increased the number of interference complaints that are received by Power Companies. It was stated that several A. C. receiver sets have been placed on the market which do not contain proper filter circuits. These sets will operate satisfactorily on power systems with exceptionally good wave shape. On other systems a situation requiring serious consideration has arisen.

The high voltage pin type insulator on existing lines still presents a serious problem. It appears that the problem has been largely solved for insulators to be placed on new lines. The National Executive Committee appropriated $3,000 to be used for research work on this problem. The Northwest Geographic Division has had this problem under some study and carried on some work with the Oregon Agricultural College. The committee recommended that this money be placed at the disposal of the Northwest Geographic Division for use at the Oregon Agricultural College.

Space Radio

The Federal Radio Commission has refused all recent applications of Power Companies for experimental licenses. They have, however, granted station licenses to permit the operation of stations for a period not exceeding 15 minutes per day. The commission has granted the companies applying for these licenses, a hearing in the near future and it is hoped that a case will be presented which will convince the commission of the necessity of permitting a longer operation of these stations during the development stage.

Geographic Division Representatives Meeting

A dinner meeting of the Geographic Division representatives was held in order to discuss the problems of the Geographic Divisions. The representatives felt one of their greatest needs was to obtain more detailed information on the work of the Joint Subcommittee on Development and Research. It was pointed out that it was necessarily a slow process to develop the fundamentals of this research and obtain mutually satisfactory reports on the results. However, the members of the Headquarters Staff, who are actively engaged in this work, are always available to the Geographic Divisions to discuss in detail the work that is being done and the results that are being accomplished. It was also pointed out that the results of the research work are also immediately available to member companies, through the participation of Headquarters Engineers as advisors to member companies in the solution of current cases.

New Subcommittees

In order that the work of the Development and Research Subcommittee will be more readily available to member companies, several new subcommittees were appointed to study practical phases of the research data that is now available and to prepare serial reports based on this work for the information of the member companies.

MARCH MEETING OF THE ENGINEERING NATIONAL SECTION:

Arrangements have been made for the group meetings of the Engineering National Section to be held at the Edgewater Beach Hotel in Chicago on March 10th, 11th, 12th and 13th. The schedule of meetings will be approximately the same as for the Pittsburgh meetings. Committee Chairmen will be furnished a corrected schedule shortly.

Meter Committee Meeting

A. S. ALBRIGHT, *Chairman*

THE first regular meeting of the National Meter Committee for the current year was held at Pittsburgh, Pa., on Oct. 2 and 3.

The meeting was devoted to a discussion of operating problems in connection with metering, a complete reorganization of the committee and the discussion of subcommittee reports.

The following were subjects for much consideration and the exchange of valuable information.

Lightning Protection for Low Voltage Meters.

The Application of Curves in Transformer Testing.

The Use of Extended Load Characteristics of Watthour Meters.

Two-Rate Metering.

Insulation Test on Meters.

The Use of Three-Wire Current Transformers.

The Engineering Subcommittee was authorized to begin the preparation of specifications for dielectric tests of the insulation of watthour meters.

A number of serial reports were reviewed and advanced for publication.

There were 34 in attendance in addition to the representatives of the meter manufacturers.

A program for the year was developed under the direction of Chairman Albright, which includes a number of important investigations in connection with watthour meters as well as metering and service equipment.

Prime Movers Committee Meeting

R. D. DEWOLF, *Chairman*

THE meeting of the Prime Movers Committee held at Pittsburgh, Pa., Sept. 30 and Oct. 1 was attended by a total of 62 counsellors, members, alternates and guests.

This being the first meeting of the year the general organization of the committee and methods of presenting preliminary and final reports were discussed at some length. A new method of presenting preliminary reports was agreed upon whereby subcommittee chairmen will present a typewritten outline of the work to be covered which we believe will reduce the amount of time required in presentation of such reports. Some changes in the method of presentation of final reports were also discussed and the essential features brought to the attention of the committee.

Preliminary reports were presented by the following sub-committees:

Boiler and Turbine Room Instruments,
Burning of Liquid and Gaseous Fuels,
Coal and Ash Handling,
Condensing Equipment,
Oil and Gas Machines,
Treatment of Feed Water,
Power Station Chemistry,
Station Piping,
Pulverized Fuel,
Stoker Equipment and Furnaces,
Turbines,
Foreign Developments,
Boilers, Superheaters and Economizers,
Distillation Products of Coal.

It was decided that the Turbine Subcommittee should collect operating data on large machines each year, instead of every two years. Many of the companies have adopted forms for keeping their operating data which conform with the requirements of the Turbine Subcommittee so that this data can be easily transcribed to the Turbine Subcommittee forms which will be sent out about the end of the calendar year.

The value of Round Table discussion was emphasized and it was decided to appoint a subcommittee to take charge of the preparation of matters to be brought up for discussion.

Mr. Grunert presented an interim report on Pulverized Fuel explosions supplementing the report previously sent out to all committee members.

The Geographic Divisions were unusually well represented and ample evidence was given of the increasing activity of this line of work. Brief reports and discussions of the work of these Geographic Division Prime Movers Committees were presented by representatives of the following divisions:

Southeast Division,
Pacific Coast Division,
Great Lakes Division,
Southwest Division,
East Central Division,
Eastern Division,
Middle West Division,
Northeast Division.

Upon invitation of the chairman, Mr. Hopwood and Dr. Hall of the Hall Laboratories, Inc., discussed the research work done by Dr. Hall on Feed Water Treatment. Following Mr. Hopwood's address a vote of thanks was extended by the committee to Dr. Hall and Mr. Hopwood for appearing before the Committee.

The next meeting of the committee will be held in Boston Nov. 18 and 19.

Underground Systems Committee Meeting

G. B. McCabe, *Chairman*

The Underground Systems Committee held its initial meeting for the Administrative Year of 1929-1930 in conjunction with the Group Meeting of the Engineering National Section at the William Penn Hotel, Pittsburgh, Pa., on Oct. 2 and 3, 1929. Three half-day sessions were devoted to discussions and one half-day session was spent in inspecting the plants of nearby industries and interesting installations on the system of the local operating company. The total attendance at the meeting was 99 (consisting of 41 members, 8 Geographic Division representatives, 14 manufacturer's representatives and 36 guests). The above 63 members present represent 61 per cent of the total official membership.

The first part of the meeting was devoted to an outline of the plans and reorganization of the committee work by Chairman G. B. McCabe.

Committee Organization

While it is planned to maintain practically the same subcommittees, these will be divided into three groups: namely, the Construction, Operating and General, for the purpose of more efficient administration. The organization of the committee is as follows:

Chairman, G. B. McCabe; *Vice Chairman,* C. T. Sinclair; *Secretary,* L. F. Hickernell.

Construction Group — Chairman, C. N. Rakestraw; Vice Chairman, A. F. Randolph.

1. A-C Networks Construction Subcommittee—Chairman, M. T. Crawford.
2. Cable Installation Subcommittee—Chairman, G. M. Miller.
3. Cable Joint Design and Construction Subcommittee—Chairman, C. W. Franklin.
4. Conduit and Manhole Construction Subcommittee—Chairman, C. E. Hickey.
5. Standardization of Fittings for Manhole Equipment Subcommittee — Chairman, L. G. Smith.

Operating Group — Chairman, T. H. Haines; Vice Chairman, C. H. Kraft.

1. A. C. Networks Operation Subcommittee —Chairman, H. S. Davis.
2. Cable Operation Subcommittee—Chairman, H. Halperin.
3. Conduit and Manhole Temperature Subcommittee—Chairman, J. A. Brooks.
4. Cable Sheath Damage and Protection Subcommittee—Chairman, N. E. Buck.
5. Inspection and Testing of Cables Subcommittee—Chairman, F. M. Farmer.

General Group (Reporting direct to Chairman)

1. Impregnated Paper Insulated Cable Research Subcommittee—Chairman D. W. Roper.
2. Underground Systems Reference Book Editorial Staff—Chairman C. T. Sinclair.
3. Geographic Division Coordination Subcommittee—Chairman, J. W. Sylvester.
4. Editing Subcommittee—Chairman, C. T. Sinclair.

The chairman of the subcommittees, together with the past chairmen of the main committee now form an executive committee, the purpose of which is to assist the chairman in deciding upon methods of policy, to relieve the main committee of detailed consideration of reports and other routine matters and in general to act as a steering committee to the main committee.

Scheduled Meetings

It is planned to hold a two day meeting on Jan. 21 and 22 at Washington, D. C.

Programs for Meetings

There will be presented at each meeting of the committee, one or more papers dealing with novel and interesting installations and methods.

It is also planned to devote one-half day session to exchanging operating experiences among the members of the committee in a meeting limited to the members-at-large only.

Geographic Division Coordination

To effect closer coordination with the work of the several Geographic Division committees and to avoid duplication of effort, a Geographic Division Coordination Subcommittee was formed with Past-Chairman J. W. Sylvester as Chairman, and the Geographic Division representatives as members.

Editing Subcommittee

At the suggestion of the Section Chairman, an Editing Subcommittee. whose duties shall be to pass on the form and general make-up of all committee reports, was appointed.

Secondary Cable Fault Tests

E. W. Oesterreich, Duquesne Light Company, presented a very complete paper on the results of a series of tests made to determine the relation between the amount of current and the time required to burn in two various sizes of conductor when subjected to a copper-to-copper short circuit as may be experienced in a-c network installations.

Reel Standardization

H. G. Hurd, Chairman of the Reel Standardization Subcommittee of the Insulated Power Cable Engineers Association, announced that the reel standards developed by the association and presented to the committee last year had been put into effect and that a trial installation was also being made with steel reels. Considerable advantage is expected to be gained in the use of the steel reels in view of the less storage space required and the reduction in freight costs in returning them to the manufacturer.

Fittings for Manhole Equipment

L. G. Smith, Consolidated Gas, Electric Light and Power Company, Baltimore, Chairman of the Standardization of Fittings for Manhole Equipment Subcommittee, presented a report of the survey to determine the existing designs made by his subcommittee. This survey showed that there were a great many varieties of designs of this equipment for accomplishing the same purpose. It is hoped to develop a set of suggested specifications so that apparatus commonly replaced may be changed with the minimum amount of installation changes.

Underground Systems Reference Book

C. T. Sinclair, Byllesby Engineering and Management Corporation, Pittsburgh, Editor-in-Chief of the Editorial Staff of the Underground Systems Reference Book, reported that the manuscript for the Reference Book will be completed by the first of November. It is accordingly expected that the book will be available for distribution the latter part of next year.

Ventilation of Manholes

J. W. Sylvester, Philadelphia Electric Company, presented a summary of the answers to a questionnaire on the ventilation of manholes compiled from replies by thirty-seven companies. This summary indicated that a large majority of the companies considered ventilation necessary but that methods for accomplishing it vary widely. Most of the companies also indicate that ventilation materially improves their underground system operation. This data has been turned over to the Subcommittee on Conduit and Manhole Construction for further study and use.

Subcommittee Plans

A portion of one of the sessions was devoted to an outline of the work of each subcommittee by its chairman. As customary, the reports of these subcommittees will be presented at the following meetings of the main committee and an effort will be made to circulate the reports at least two weeks prior to the meeting so that an adequate and thoughtful discussion of the subject and material will ensue.

A-C Electrolysis

K. W. Miller, Commonwealth Edison Company, presented an informal paper on some of the results of an investigation by his company on the effect of a-c electrolysis on lead sheaths of single conductor cables on three phase circuits. This study was undertaken to determine the resistance of the sheath and fire-proofing to ground in order that the voltage existing on the sheath may be calculated. The rope sometimes used in fire-proofing when laid directly against the lead sheath was found to be detrimental since it allows electrolyte to get near the sheath and thus increase the corrosive action. The use of non-impregnated asbestos tape next to the sheath was found to be the best practice. No observable corrosion on the cables in the duct was discovered, all of it taking place underneath the fire-proofing. No trouble at the duct mouth due to corrosive action was experienced.

In general they believe that 12 volts is not objectionable for stone ducts when using commercially-pure lead sheaths. However, some of the newer oil-filled cables are provided with a sheath of an alloy lead containing antimony or tin, and in these cases the value of permissible potential may be somewhat different.

Operating Experiences

A half-day session was devoted to a discussion and exchange of operating experiences, the attendance being confined to members-at-large. Some of the subjects under discussion were: (1) Corrosion of transformer tanks (2) Solder-seal type of potheads and joints (3) Backwater Valves (4) Electrolysis (5) Fiber Duct (6) Use of non-leaded cables in ducts (7) Oil filled type of station outdoor potheads, and (8) The practice of using a bare copper neutral on 4 kv. Systems.

Overhead Systems Committee Meeting

SYDNEY ALLING, *Chairman*

THE fall meeting of the Overhead Systems Committee was held at the William Penn Hotel in Pittsburgh on Sept. 30 and Oct. 1 with an attendance of 80 members and visitors. This meeting was preceded by a meeting of the Executive Committee held on Sept. 29 at which time action was taken changing the names of the four main subdivisions of the committee from "Subcommittees" to "Groups." The subdivisions of Groups will hereafter be known as "Subcommittees."

The first day of the meeting was given over to group and subcommittee reports, and an interesting talk by Mr. J. R. Coolidge of the Montan Treating Company, on the Montan Process of Timber Preservation.

This was followed by a general discussion of subjects of vital interest to members of the Overhead Systems Committee.

Reports were made for the following subcommittees:

Distribution Group

- Distribution Design
- Line Construction Operating Methods
- Joint Use Specifications
- Line Construction Organization Methods

Safety Rules Group

Materials and Equipment Group

- Wood Preservation
- Hardware, Insulators and Wire
- Distribution Transformers
- Protective and Switching Devices
- Material Inspection
- Construction and Maintenance Equipment and Methods
- Construction Specifications

Transmission Group

- Maintenance Equipment and Methods
- Marking and Lighting Transmission Lines
- Insulator Research
- Operating Records
- Operating Procedure
- Steel Tower Transmission

The morning session of the second day was taken up by illustrated talks by L. F. Heckmann of the South Bend Works of the Westinghouse Electric & Manufacturing Company on the Manufacture of Hollowspun Concrete Poles and by W. W. Lewis of the General Electric Company and J. H. Cox of the Westinghouse company on the lightning research being conducted by these companies on transmission lines of power companies.

These talks, including the one given by Mr. Coolidge, were of great interest and were followed by numerous questions and interesting discussions.

The afternoon of the second day was devoted to inspection trips to points of general interest to Overhead Systems Committee members.

On the evening of Sept. 30, a dinner meeting was held for the Geographic Division representatives. Ten of the twelve divisions were represented and programs for the coming year were discussed.

The winter meeting of the Overhead Systems Committee will be held during January, the location and dates to be announced later.

Power Systems Engineering Committee Meeting

L. W. W. MORROW, *Chairman*

DURING the past year this committee confined its work largely to the development of the principles to apply in the development of a master plan for a utility system whereby the future could be measured in some degree. At the first meeting of the administrative year, held in Pittsburgh, with an attendance of 70 men, a general discussion of the work for this year was had. It was decided that a few subcommittees could clarify and make tangible the several features of the master plan and these were appointed and the scope of their work outlined.

As part of the program for the year, it was proposed that several utility systems be described and discussed by the committee as a whole so that the diversity of service and load conditions could be outlined fully. At the next meeting in Chicago on Jan. 16 and 17, a feature of the sessions will be these discussions of properties.

The subcommittee on interconnection outlined the scope of its work at the Pittsburgh meeting in general terms as follows:

1. How should a survey of interconnection possibilities for a given system be made?
2. What yardsticks may be established for interconnection?
3. What policies should be recommended?
4. What principles should be established in preventing troubles and operating difficulties?
5. What are the principles for contracts and agreements?

At the final session of the committee, E. C. Stone outlined the budgeting and planning work of the Duquesne Light Company and W. J. Lyman discussed the layout of the system. J. S. Jenks spoke on the duties of the engineer and stressed the need for the use of the economic point of view and the necessity for taking the future into consideration.

Kemp Appointed to Work on Research Organization

MR. W. V. A. KEMP has been attached to the engineering office at N.E.L.A. headquarters to devote himself to the organization of research projects within the scope of the Research Committee of the Engineering Section. A notice of the program of this committee appears in this issue.

Mr. Kemp has been the director of the Committee on Heat Transmission of the National Research Council, and he will continue this activity concurrently with his work in the N.E.L.A. He may be reached at the former office, 40 West 40th Street, New York, or through the N.E.L.A. headquarters office.

Outline of Work of the Meter Committee in 1929-1930

A. S. Albright, *Chairman*

DURING this year the Meter Committee will direct its attention along three general lines:

1. Standardization of Meters and Metering Equipment.
2. New Developments in Metering Methods and in Equipment.
3. Educational Work and Training Courses for Metermen.

Standardization within reasonable limits, is an aid toward economy and simplification. The committee has always had the hearty cooperation of the various manufacturers toward this end, and this condition will undoubtedly continue. Recent improvements in design and construction have placed watthour meters, instrument transformers and their allied equipment on a plane where additional betterments are difficult. Certain changes may be worked out, however, tending toward uniformity of installation facilities. Outdoor metering has received considerable attention recently and the committee hopes to see a fairly standard scheme adopted where such metering is advisable.

The announcement of *New Developments,* both in methods of metering, and in available equipment has always been one of the principal duties of the Meter Committee, and is a real service to the industry. New situations are constantly arising which call for out-of-the-ordinary equipment. New rate schedules are drawn or interconnection plans are devised which may require special methods of metering. The committee attempts to keep itself informed of these innovations, and to pass the information along through the media of serial reports or special articles.

In its efforts to educate the metermen, the committee will continue to sponsor the University Short Courses, since the general opinion is that these courses have been a benefit to those who have attended. The completion and further distribution of the correspondence course, on which the committee has been working for the past two years, will be carried on. This course evidently filled a real need, since the distribution to date by the Educational Committee has been quite general. The Handbook for Electrical Metermen is still being sold. It will be necessary to revise this handbook before long, and the committee should study this matter during the year.

Power Level of Telephone Circuits Uuder Study by Joint Committee

THE work of the Joint Subcommittee on Development and Research, in addition to being directed to the more immediate problems which have been mentioned in previous articles, has also been in part directed to questioning the fundamental basis of the design and operation of communication and power systems from the standpoint of their coordination. It is recognized that both must expand and render greater and better service to the public. The power engineer fully recognizes that he must render more continuous service with better voltage regulation than was required a few years ago. Likewise the telephone engineer must supply circuits with higher transmission quality and less noise than those which were acceptable in an earlier stage of the art.

A part of this work of the committee (under Project No. 7) has been a consideration of the magnitude of telephone power flowing over telephone circuits. Evidently the interfering effect of any extraneous noise introduced into a telephone circuit is dependent not so much on its absolute magnitude as on its magnitude relative to the amount of telephone power flowing in the circuit. The telephone power level is affected (1) by the characteristics of the telephone instrument, particularly the transmitter, and the manner in which the telephone subscriber uses this instrument, and (2) by the changes undergone by the currents put out by the transmitter in passing to the telephone central office and then over the circuit to the distant telephone office and from there to the distant subscriber. The committee has reviewed the changes which have taken place in the design of telephone plants over a period of past years and has found that the trend has been toward higher levels.

As regards telephone transmitters the present instruments for a given sound input send out about three times the electrical output of the transmitter of 15 years ago. Incidentally while the power flowing in a telephone line is very small compared to that in power circuits it represents at the sending end a power several hundred times the voice power which actuates the transmitter.

As a possible way of better controlling the power levels on the line the committee has considered in the case of long distance open wire circuits the proposition of applying high powered repeaters since it is these longer circuits on which noise is frequently most troublesome. Certain high powered repeaters were made available for tests and tried out on a considerable scale on the central transcontinental route from New York to San Francisco and brought about the expected noise improvement. Any long distance circuit, however, such as this, has exposures to a large number of shorter circuits. It was found that raising the level on the long circuits resulted in undue crosstalk into these other circuits of the lead. It was concluded that but little application could be made of this remedy without radical changes in the configuration of the open-wire lines. Considerable work is being done in studying the effect of such change in configuration. Another arrangement considered was the use of high powered repeaters applied to all the circuits of a given pole line in sections where unusually severe interference is encountered. The expense of this is such that no cases have been found where it appeared economical as compared to other engineering methods for improving the situation.

A consideration of the line circuits in general has shown, however, that repeaters have already resulted in improvement in the levels of the power in telephone circuits. Of course, the biggest advantage of telephone repeaters from the interference coordination standpoint has been in their making possible the use of long toll cables and open-wire carrier circuits which have removed a considerable part of the coordination difficulties with toll circuits.

1929 REVISION OF NATIONAL ELECTRICAL CODE TO BE KNOWN AS 1930 CODE

On account of the delay in printing the 1929 Revision of the National Electrical Code, which is now not expected to be available until December 1, 1929, or shortly thereafter, the National Fire Protection Association proposes to call the new code the "1930 National Electrical Code." The N.E.L.A. has assented to this proposal.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

East Central Division Activities

By Thorne Browne

Secretary and Treasurer, East Central Division, N. E. L. A.

OHIO
EAST
CENTRAL
GEOGRAPHIC
DIVISION
W.V.
KY.
N.E.L.A.

The East Central Division of the National Electric Light Association was very active in the celebration of Light's Golden Jubilee. There is probably no other Division in the United States that gave more attention to this event than did our Division. In nearly every city fine celebrations were held, while luncheon clubs and other organizations had special programs which portrayed light's great importance and its effect on humanity.

The work of the standing committees of the Division is in better shape than in any previous year. Under the excellent leadership of the several national section chairmen, the committees have arranged their preliminary work and a schedule of their winter meetings. All chairmen of committees were called together for a meeting at the West Virginia Utilities Association convention, held at Wheeling, October 23 and 24. This is an annual affair and is used more as a clearing house for the standing committee work than for directing the work itself. Conflicts in dates are avoided and correlation of work brought about.

The Accident Prevention Committee has carried on its work throughout the summer, and monthly reports are made covering the campaign on accident prevention. It is very gratifying to know that an improvement in lessening the number of accidents has been brought about.

The Executive Committee of the Division will meet some time in November to fix the time and place of the 1930 convention. The question whether the Division will go to a resort or city will be the principal bone of contention at that meeting. The probabilities are that it will go to a city as it did last year at Louisville.

One of the problems that faces all of the Divisions, and especially the East Central Division, is the matter of avoiding the month of June for a convention. Due to the distance of the National Convention at San Francisco, it will be necessary to leave practically all of the month of June open for those who desire to attend the National convention, and that month is the most desirable month of the year for holding the East Central Division convention, as then it is very beautiful in any of the three States comprising the Division.

In 1922 the convention was held in May and the advantage of a convention that far in advance of the closing of the National Association year was apparent throughout the year's work. But holding our convention earlier than June seriously interferes with getting everything in shape for the National convention. At this writing, if the secretary were to make a guess as to where the convention of 1930 would be held, he would say Cleveland, Cincinnati or Columbus, Ohio.

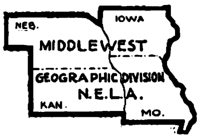
Considerable work is being done along the line of rural service, and a loose-leaf handbook on that subject has just been published. While this initial issue contains only data on water pumping, other data on feed grinding, ensilage cutting and kindred subjects will follow in a short while.

The East Central Division has every hope that the close of the year on June 30 next will witness the passing of the most active year of its existence.

Middle-West Division Activities

By Thorne Browne

Director, Middle-West Division, N.E.L.A.



The month of September and the first half of October saw all committees of all sections completely organized and most of those committees getting lined up for a year of activity.

Meetings have been held and full plans outlined for the year by the Accounting Section, the Rural Electric Service Committee, Public Speaking Committee, and the Women's Committee.

Accounting Section

The Accounting Section met at Kansas City on Sept. 16 with twelve members present. In an all day session, the committees planned their work for the year, dovetailing in with the national activities as they are developed, and developing some interesting data and recommendations for the division itself.

The Classification of Accounts Committee will continue its efforts to have the State of Missouri approve the standard classification and in a mild way to get those member companies who do not now fully follow the standard to make adjustments in that direction.

The Customer Records Committee will continue last year's efforts in development of standard practices on consumers' deposit precedure, machine billing methods, and merchandise billing.

The Fixed Capital Committee will utilize the data obtained last year from a questionnaire in the making of a report and recommendations. The General Records Committee will make a survey of payroll methods and add some recommendations concerning transportation accounting which the same committee studied last year.

The Purchasing and Storeroom Committee outlined rather extensive studies of prevailing practices within the division with a view to preparing a report and making recommendations to member company auditors.

Rural Service Committee

The Rural Electric Service Committee met at Omaha on Sept. 20. This committee is made up of the general chairman and the chairman of each State section committee together with the chairman of the Rural Merchandising Committee of the Commercial Section, the Customer Records Committee of the Accounting Section, and the chairman of the Overhead Systems Committee of the Engineering Section.

This committee undertook, in conjunction with the Accounting Section, to establish member company accounting practices on rural service on such a basis as will be entirely accurate. Chairman Moylan of the Accounting Section has undertaken to deal with this subject, and to that end is already in touch with the auditors of all member companies.

The Rural Service Committee is also sponsoring jointly with the state rural committees a conference, in each of the States of the division, for discussion of rural service problems. The first of these will be held in the late fall.

Standard contracts of member companies for rural service will also be studied by the committee for the purpose of making a report covering the general scope of these contracts with possible recommendations.

Public Speaking Committee

The Public Speaking Committee held its first meeting at Kansas City on Sept. 10 and outlined a plan for a more complete organization. Inquiries have been sent to each member company asking each to designate one individual in that company to be supervisor of public speaking in the territory served by it. Generally, this supervisor has been named. Since the State sections do not have public speaking committees, one member of the Middle-West Division has been named in each State to keep in touch with speaking activities and to secure monthly reports.

Plans are under way for the elimination contests of the National Employees' Speaking Contest.

Women's Committee

The Women's Committee has been very active. A session was held at Kansas City on Sept. 9 at which there was full attendance. Reports indicated complete organization in two of the four States of the division and only local organizations in the other States. Plans were perfected to secure coordination of activity in these two States.

Since the date of the meeting, Chairman Louise Hathaway has held a meeting in each of the two States where the organization was not satisfactory. These meetings were largely attended by representatives of member companies. Bulletins showing the activities of local women's clubs will be published monthly in each of the States and distributed. All are pledged to carry out this year's program activities in accordance with seven points set forth as the goal of the committee. These seven points are:

1. Know the company personnel and the territory served by your company.
2. 50 per cent of the girls to deliver a talk pertinent to the industry, copy of same to be sent to the state chairman for record.
3. Safety First Work:
    25 per cent to have knowledge of prone pressure method of resuscitation.
    75 per cent to have knowledge of first aid emergency methods, viz:—treatment of bruises, cuts, fainting, poisoning.
    100 per cent ideal of safety first.
4. Specific knowledge of initial and maintenance costs, operation and care of two major and five minor appliances.
5. One general meeting including wives of employees.
6. At least one educational meeting on "Rural Electrification."
7. To carry the thread of "Employees' Relation to the Customers" all through the year's program.

Commercial Section

The Commercial Section is continuing its standard activities. During September and the first half of October it distributed widely through headquarters office four sales campaign plans on electric water heaters, one campaign on portable lamp sales, and one on industrial electrical heating.

Great Lakes Division News Letter

By Tom C. Polk

Secretary, Great Lakes Division, N. E. L. A.

WIS
GREAT LAKES
GEOGRAPHIC DIVISION
N.E.L.A.
MICH
IND.
ILL.

The ninth annual convention held at French Lick, Ind., on Sept. 26, 27 and 28, with a registration of 817, was the most successful convention ever held in the Great Lakes Division.

One of the outstanding features was the lighting of the Japanese Garden and hotel grounds in commemoration of Light's Golden Jubilee. This display was in charge of the Lighting, and Light's Golden Jubilee Committees and was made possible by the cooperation of the Manufacturers and the Interstate Public Service Company.

Purdue University held its third annual conference on Rural Electrification in cooperation with the Indiana Electric Light Association, on October 10, 11 and 12. One hundred and thirty-three were registered from nine States. The Rural Electric Service Committee of the Great Lakes Division met during the conference and outlined its work for the year.

The University of Wisconsin held a Rural Electrification Conference on October 31, Nov. 1 and 2. A splendid program was arranged.

The Engineering Section of the Great Lakes Division met at Madison, Wis., on October 23, 24, 25 and 26. After the first general session, the several committees devoted the balance of the time to organization and round table discussions of the year's program of activities. A. D. Bailey, chairman of the Engineering National Committee; G. C. Neff, president, and Tom C. Polk, secretary of the Great Lakes Division, were speakers at the dinner on Thursday night.

The Commercial Section of the Division had its first meeting at the Leland Hotel, Detroit, Mich., on October 28. Plans were made for the second meeting which will be held in Chicago in January and will include an Electrical Advertising School and a Merchandise Sales Conference.

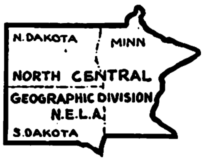
A. E. Scott, chairman of the Public Relations Section, Great Lakes Division, announces a meeting of this section to be held in Chicago in November.

The Great Lakes Division offices will be moved to the new Chicago Civic Opera Building, 20 North Wacker Drive, the last week of November.

North Central Division News Letter

By John W. Lapham

Secretary-Treasurer, North Central Electric Association



The North Central Electric Association started out the activities of the new year with an Accounting Conference, Oct. 28-29, 1929, at the Nicollet Hotel, Minneapolis, Minn. Fred Herbert, Service Director, N. E. L. A. Headquarters; W. R. Emerson, N. E. L. A. Accounting Chairman, Oklahoma City, Okla.; C. E. Packman, Middle West Utilities Company, Chicago; B. F. Braheney, General Auditor, Byllesby Management and Engineering Corporation, Chicago; were some of the out of the district speakers of the occasion J. J. Molyneaux, Treasurer of the Northern States Power Co., Minneapolis, presided as Toastmaster of the banquet which contained many interesting entertainment features.

A. L. Burgess, Northern States Power Co., Chairman of the Accounting Section, presided over the sessions with the help of F. R. Gamble, Minnesota Northern Power Co., vice-chairman of the section.

Other talks at the meeting were as follows: "Credit Practices to Watch," John W. DeMaine, Northern States Power Co., Minneapolis, Minn.; "The Human Side of a Balance Sheet," P. O. Johnson, Northern States Power Co., Minneapolis, Minn.; "Fixed Capital Records," J. A. Hennesey, Northern States Power Co., Minneapolis, Minn.; "Customers' Records," B. McTeigue, Minnesota Power & Light Co., Duluth, Minn.; "Changes in Classifying Accounts," W. L. Hatch, Otter Tail Power Co., Fergus Falls, Minn.; "Improved Practices in Purchasing and Storeroom Accounting," E. G. Kellett, Northern States Power Co., Minneapolis, Minn.; "Changes in General Records Practices," C. L. Sandstedt, Northwestern Public Service Co., Huron, S. D.; "How to Better Use Statistics?" Fred Brown, Northern States Power Co., Minneapolis, Minn.; "The Electrical Situation," John Lapham, Minneapolis.

The program for the year includes the following: Women's Committee Conference, Nicollet Hotel, Minneapolis, Minn., Nov. 22-23, 1929; Commercial Conference, St. Paul Hotel, St. Paul, Jan. 20-21, 1930; Engineering Conference, Nicollet Hotel, Minneapolis, Feb. 24-25, 1930; Managerial Conference, Alex Johnson Hotel, Rapid City, S. D., June 11-12, 1930.

A number of the companies are arranging to enter the Employee Speaking Contest.

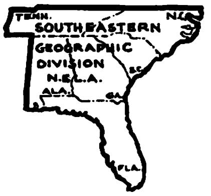
Light's Golden Jubilee was observed quite generally throughout Minnesota, North Dakota and South Dakota. The dome of the State Capitol at St. Paul, Minn., was floodlighted for the first time in its history, and it will probably be continued permanently by the State of Minnesota. Broadcasting conditions were very good throughout the district and a great many of the electrical people invited their friends and neighbors to hear the broadcasting on Oct. 21.

Ninety per cent of the population served by the power companies in the three states have received rate reductions during the past few months and each company is "hitting the ball" very hard on Commercial Sales, with surprisingly good results.

Warm Breezes from the Southeast

By C. M. KILIAN

Executive Secretary, Southeastern Division, N. E. L. A.



Your correspondent hopes that the title of this report will not suggest to any readers of this column that at times the warm breezes may be developing into hot air, for he hopes to confine himself to the facts, uninteresting though they may be. He realizes, of course, that every section in the country will want to show up in the most favorable light and he may, therefore, at times be sorely tempted to stray from the paths of truthfulness. He will, however, do his best to restrain himself.

Considerable interest is being manifested in the Employees' Speaking Contest, although it is not at this time possible to report one hundred per cent participation by member companies.

Unusual interest is being manifested by the women of the Division in a unique competition under which every member of a company women's committee has the opportunity of acquiring honors for herself and her committee.

The Engineering Section held a series of group meetings on October 21 and 22, and the following subjects were thoroughly discussed:

An Exposition of System Planning, as practised in a Large Southern City.
Railroad Crossing Policy—National Development.
Movie of Hydro Plant Construction—Carolina Power and Light Company.
Telephone Protective Practices on Power Line Telephones.
Paper and Discussion on Non-Metallic Lead Sheathed Cable.
National Developments in:
  Electrical Apparatus.
  Inductive Coordination.
  Underground-Overhead Systems.
  Meter Practice.
  Safety Methods.
  Prime Movers.

The two publications of the Division, *Nela-Graph* and *Light Pointers*, continue to have a growing mailing list.

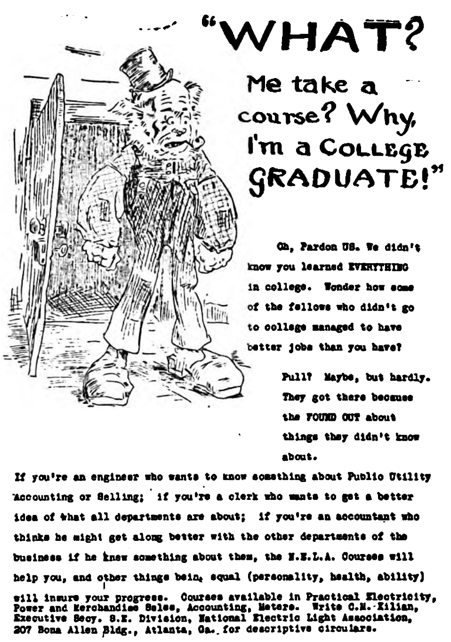
Of particular interest to the executives of the Division have been orders from holding companies for comparatively large quantities of the reports issued by the several committees of the Division.

Of interest to those Association members who have not made full use of the N. E. L. A. Committee reports, are the comments, developed in a recent survey, of those using the reports in this Division. Typical comments follow:

> " . . . . . All of the Engineering reports received are read by almost every engineer of this department and they have been helpful in many ways because they have given us a somewhat broader aspect in our daily endeavors than we would have had, had we not received them . . . . ."
>
> " . . . . . The report on Neon Sign Metering will be of particular help to our Company . . . . ."
>
> " . . . . . I study the points brought out in the N. E. L. A. reports closely and attempt to use such ideas we find in them in our business . . . . ."
>
> " . . . . . The experimental and new installations in the industry have been of value in solving some of our problems by pointing out ways of bettering efficiency or by preventing duplication of unsuccessful experiments which would be the case if we were not kept advised of the efforts of others . . . . ."
>
> " . . . . . The reports in bringing out practices of other companies have indicated ways of improving existing methods of handling certain work . . . . ."

There were fifty-two other comments received. All of them testimonials outlining some particular way in which the reports have been beneficial.

The Divisional office has inaugurated a plan for distribution of a series of bulletins on the N. E. L. A. Educational Courses for posting on member company bulletin boards. This has resulted in greatly increasing the number of inquiries concerning these courses. (Two of these bulletins, greatly reduced, are reproduced herewith.) Samples of these bulletins may be had upon request to the secretary of the Southeastern Division, 207 Bona Allen Building, Atlanta, Ga.

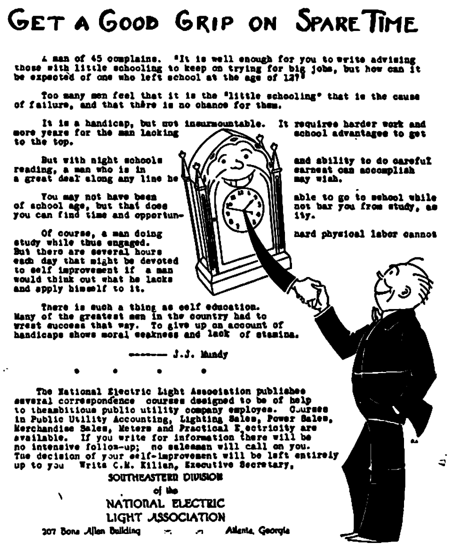


"WHAT? Me take a course? Why, I'm a COLLEGE GRADUATE!"

Oh, Pardon US. We didn't know you learned EVERYTHING in college. Wonder how some of the fellows who didn't go to college managed to have better jobs than you have?

Pull? Maybe, but hardly. They got there becuase the FOUND OUT about things they didn't know about.

If you're an engineer who wants to know something about Public Utility Accounting or Selling; if you're a clerk who wants to get a better idea of what all departments are about; if you're an accountant who thinks he might get along better with the other departments of the business if he knew something about them, the N.E.L.A. Courses will help you, and other things bein, equal (personality, health, ability) will insure your progress. Courses available in Practical Electricity, Power and Merchandise Sales, Accounting, Meters. Write C.M. Kilian, Executive Secy. S.E. Division, National Electric Light Association, 207 Bona Allen Bldg., Atlanta, Ga. for descriptive circulars.



GET A GOOD GRIP ON SPARE TIME

A man of 45 complains. "It is well enough for you to write advising those with little schooling to keep on trying for big jobs, but how can it be expected of one who left school at the age of 12?"

Too many men feel that it is the "little schooling" that is the cause of failure, and that there is no chance for them.

It is a handicap, but not insurmountable. It requires harder work and more years for the man lacking school advantages to get to the top.

But with night schools and ability to do careful reading, a man who is in earnest can accomplish a great deal along any line he may wish.

You may not have been able to go to school while of school age, but that does not bar you from study, as you can find time and opportunity.

Of course, a man doing hard physical labor cannot study while thus engaged. But there are several hours each day that might be devoted to self improvement if a man would think out what he lacks and apply himself to it.

There is such a thing as self education. Many of the greatest men in the country had to wrest success that way. To give up on account of handicaps shows moral weakness and lack of stamina.

——— J.J. Mundy

• • • •

The National Electric Light Association publishes several correspondence courses designed to be of help to theambitious public utility company employes. Courses in Public Utility Accounting, Lighting Sales, Power Sales, Merchandise Sales, Meters and Practical Electricity are available. If you write for information there will be no intensive follow-up; no salesman will call on you. The decision of your self-improvement will be left entirely up to you Write C.M. Kilian, Executive Secretary,

SOUTHEASTERN DIVISION
of the
NATIONAL ELECTRIC
LIGHT ASSOCIATION
207 Bona Allen Building Atlanta, Georgia

The Southeastern Divisional office took a leading part in the organization and direction of the Atlanta celebration of Light's Golden Jubilee. With the revelation that Ye Scribe, in addition to his many hitherto known talents, is also an able (?) orator of note. He has found himself so busy delivering eulogisms on Thomas Edison, electric refrigeration, the Value of Cooperative Effort and the Rightful Place of the Fair Sex (in the home, on the street or in the office), that he has thown away his quill and duster and bought a megaphone instead.

On one occasion he addressed a group of boys who were inclined to be rather noisy, so he shouted:

"You kids are making so much noise I can't hear what I am saying."

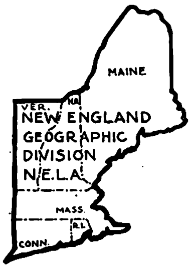
One of the little rascals shouted back:

"That's all right, Mister, you aint' missing nuthing."

New England Division Activities

By O. A. Bursiel

Secretary, New England Division, N. E. L. A.



Members of the New England Division were grateful for the opportunity to do their part in the celebration of Light's Golden Jubilee, and to join with the entire world in honoring its great leader, Thomas Alva Edison. Many cities and towns throughout New England joined in this celebration with special exercises, illumination and floodlighting of buildings. The Boston observance centered about Copley Square. The Public Library, Trinity Church and Copley Plaza Hotel were floodlighted for an entire week. Many of Boston's largest buildings were illuminated on the evening of Oct. 21. The State House, the Massachusetts Institute of Technology in Cambridge and the buildings in the Harvard University Yard all were floodlighted at night.

Now the Division is all agog with the possibilities of the Employees' Public Speaking Contest. State and Geographic committees have been appointed. At a meeting of the Geographic Division Committee, plans were made for the holding of the Geographic Division contest in a central location; judges are being selected; one State has its plans all formed and well under way, and New England is all "set to go."

The new conference room adjoining the Division's headquarters is already proving a very desirable and popular meeting place for the various committees of the Division.

The chairman of the Public Relations Section of the Division, L. D. Gibbs, The Edison Electric Illuminating Company of Boston, held a meeting of his several chairmen on Wednesday, Oct. 23, at which time plans were made for an all-day meeting of the Section to be held at the Copley Plaza Hotel, Boston, on Nov. 14. A most interesting program for the day was outlined.

Messrs. Sloan and Sampsell at French Lick Springs

Great Lakes Division Convention

With an attendance of 817, the Great Lakes Division held an usually fine convention at French Lick Springs, Ind., Sept. 26-28. A feature of the convention was the address by M. S. Sloan, president of the N.E.L.A.

Discussing the matter of utility mergers, Mr. Sloan said the reorganization of the electric utility industry into larger units was a natural process justified by changes in the technique of operation and management. It has not been and is not now in every case true that consolidation and combinations are properly conceived and executed, but as a general thing they are. The trouble is that the virtues of the reintegration of the industry are not clear to the public, a condition that must be corrected. (The complete text of Mr. Sloan's address was published in the October issue of the N. E. L. A. Bulletin.)

G. C. Neff, president of the division, made a strikingly good presentation of the political aspects of the utility business and concluded with a strong plea for earnest efforts to reach public understanding.

Paul S. Clapp, managing director N.E.L.A., followed Mr. Neff with an inspiring recital of the growth of the industry and of its growing importance in the homes of the nation. Mr. Clapp summed up the political and economic forces that now engage the attention of the industry.

C. F. Hirshfeld of the Detroit Edison Company, spoke on the value and necessity of research in the electricity supply industry. He said that only 10 per cent of the money spent in research is directed toward the investigations in pure science which must be the foundation of the applied science of the future. As a result applied science is on the way to bankrupting itself.

Marshall E. Sampsell, chairman of the Commercial National Section, linked together the two matters of electrical merchandising and customer ownership of utilities securities. Customer-owners should, he said, on account of their financial interest in the company be most responsive to efforts made to extend the use of electrical service.

A summation of the sources of information in the electric light and power field was presented by Edwin J. Fowler, Commonwealth Edison Co.

Basing his statements on the analysis of 41 circulars referring to as many security offerings of public utilities, George C. Mathews of the Wisconsin Railroad Commission said that the selling practices indicated by information indefinitely presented or in some cases left entirely out of these circulars were such as to bring the operations almost within the province of the "blue sky" laws of many states. It is only by taking account of and correcting these conditions that the utilities can assure to themselves the continuous flow of capital which is necessary for their growth.

A. D. Bailey, chairman of the Engineering National Section, told of the need for the engineer to consider his work in a broader view and to appreciate the economic and humanitarian aspects of his profession.

Other papers listened to with much interest concerned rates, competition and power sales, industrial development activities, customer relations, lighting service, lamp sales and other subjects. A feature of the convention which must have provided many of those who saw it with inspiration for the celebration of "Light's Golden Jubilee" was the illumination of the Japanese gardens of the hotel. This work was done under the direction of the lighting committee of the division by the Interstate Public Service Company with equipment loaned by the manufacturers.

WOMEN'S COMMITTEE

Miss Sara Harris, *Chairman* **Miss Isabell L. Davie**, *Secretary*

News Letter

By Mrs. Thelma Van Ness
Publicity Chairman

A REPORT of the recent meetings of the Central Power & Light Co., San Antonio, Tex., shows that each of the eight districts is carrying on very active committee work. Current events regarding the industry are given by each member at every meeting and in some meetings a number of questions on company activities are answered. The use of appliances and job analysis are two topics which are given particular attention in these groups. Miss Alice Schuetze is the chairman.

* * *

The Avoca Live Wires, according to the Iowa-Nebraska Light & Power Company bulletin, *Live Wire Newsette,* recently voted to send a letter of welcome to each of the teachers in the Avoca Public Schools. These teachers are to be invited to meetings of the Women's Committee from time to time.

* * *

A recent issue of *The Oklahoma Meter,* Oklahoma Gas & Electric Co., published a story of a clever program at Sapulpa, Okla., celebrating Light's Golden Jubilee. The Women's Committee meeting was held in a studio setting and Mr. Edison was the honored guest—by proxy. Miss Gayle Bolner acted as announcer and Miss Lela Scott and Miss Thelma Dorr impersonated Graham McNamee and Phillips Carlin, respectively. An idea of what was to happen on the night of Oct. 21, when the greatest hook-up of radio stations ever attempted, paid homage to Mr. Edison and his incandescent lamp, was given. Edison's life history was related by members of the committee, each taking her place before the "mike," telling the important incidents and enumerating his inventions. Miss Opal Cobbs concluded the program, singing "Edison, The Miracle Man."

This program proved such a sensation that the girls were asked to repeat it for the Rotary Club of Oct. 15 and again at a joint meeting of all the Civic Clubs on Oct. 21.

* * *

The Women's Committee of the Birmingham (Alabama) Electric Company, of which Miss Ethel Bilbrey is chairman, recently assisted Miss Earline Hutcheson, Birmingham Electric Company Home Economist, in serving a luncheon to about 125 members of the Kiwanis Club of Birmingham, Ala. The subject of the principal talk at this luncheon, which was made by T. G. Brabston of the Birmingham Electric Company, was Light's Golden Jubilee. Members of the Women's Committee sang several songs, including "Edison The Miracle Man."

* * *

Miss Mary K. Walsh, The Washington Water Power Company, was in charge of the entertainment and arrangements for the annual meeting and banquet of the Spokane Business and Professional Women's Club, Sept. 10. Miss Walsh served as vice-president of the club during the past year.

* * *

A rather special meeting of Seattle Women's Committee, Puget Sound Power & Light Company, was held in September. Following the regular luncheon, the question, "Resolved: That Personal Contacts With the Public by Our Employees Are More Effective In Creating Public Opinion Than All Other Means of Publicity," was debated by competing teams of the committee. The judges were Otto L. Luther, principal of Queen Anne High School, C. E. Mong, manager of Pacific Telephone & Telegraph Co., and Miss Lulu Moulton, president of Seattle Business and Professional Women's Club, who decided in favor of the negative side. The Glee Club furnished music during the intermissions. A number of the officials of the company were present, including A. W. Leonard, president. It was the unanimous opinion that the meeting was a very interesting one.

The Seattle Committee recently entered their First Aid Team in the state-wide safety meet held in Seattle, winning second place in the contest. The team was highly complimented on its splendid work after being in preparation for the contest but a few weeks.

Bowling is quite the order of the day in the Seattle Committee at present. Twenty-four of the members are formed into four teams and are playing a series of competitive games. It is believed that this association is contributing a great deal in improved relationships among the groups.

Wenatchee Women's Committee, Puget Sound Power & Light Company, entertained Mrs. Nell Laws, Company Chairman, at their September meeting, Mrs. Laws contributing to the program by giving a resume of her trip to Atlantic City and of Women's Committee matters in general.

* * *

Mrs. Jeannette I. Rees, chairman of the Southern California Edison Company Women's Committee at Los Angeles, has announced an "Appliance Education Contest," which will be concluded at the November meeting. Prizes will be awarded. The idea of this campaign of education among the girls is to stimulate interest in appliances as every girl will be, in some measure at least, a salesman among her friends. Mrs. Rarick, of the Commercial Department, will handle the detail of this campaign. Information on various appliances was distributed among the girls with the thought that they study this data preparatory to taking an examination at the October meeting. The November meeting will feature the cooking of an "Electrical Dinner."

At the September meeting of this group, which was attended by 225 girls, five cash prizes were awarded essay writers ranking next to Mrs. Vauchelet, who won the first prize in the Pacific Coast Electric Association contest. The awarding of these prizes to the company girls was a surprise arranged by Mrs. Rees.

* * *

According to *Ye Club Chatter,* Illinois Power Company Women's Committee bulletin, Springfield, Mrs. Jessie Hunsley, chairman of the group, and also Illinois State Chairman, with Miss Edna Heermans, spent the day, Oct. 3, at the farm home of John Scherf, serving waffles, coffee and pop corn and explaining the various small appliances to all farmers and their wives who were interested. This was in connection with new rural extensions.

* * *

The Women's Committee of the Memphis Power & Light Co., at Memphis, Tenn., combined business with pleasure at a recent outing held at Overton Park. At four o'clock a special street car pulled away from the car barn, carrying Street Railway girls and Distribution Building girls up to the smaller building to pick up the girls there. Other girls rode out in automobiles and there were seventy-five girls present when Miss Favo Montgomery, the chairman, called the meeting to order. Miss Oma Buchanan, State Chairman, was the speaker of the day and following her talk, the Entertainment Committee took charge of the dinner which had been prepared by Mrs. Shaw and her helpers.

* * *

An excellent method of stimulating Women's Committee activities, and of giving to women working within the industry an insight into general industry matters, is that employed by the Women's Committee, Wisconsin Utilities Association. This committee holds a yearly conference for utility women in Wisconsin. The following program of the 1929 Women's Conference is especially interesting:

Thursday Morning, Sept. 19, 1929

Address of Welcome—Ewald Haase, Milwaukee Gas Light Company.

Response—Skulda Baner, Lake Superior District Power Co., Ironwood.

Chairman's Remarks—Ruth C. Tarum, Northern States Power Company.

Address—"Being Informed About Our Business"—E. J. Steinberg, Chairman Employees' Education Section.

Discussion led by Lyndia Hollenbeck, Wisconsin Michigan Power Company.

Four-Minute talks on the general subject "The Opportunity in My Job for Serving the Public."

Cashier—Mary Blecha, Wisconsin Valley Electric Company.

Telephone Operator — Margaret Frey, Wisconsin Gas & Electric Company.

Transportation—Meta Erdman, Wisconsin Michigan Power Company.

Purchasing Department—Marian G. Crowell, Milwaukee Gas Light Company.

Merchandising and Complaints — Agnes Larson, Menominee & Marinette Light & Traction Company.

Thursday Afternoon

Address — "Taxes" — C. E. Kohlhepp, treasurer, Wisconsin Public Service Corp., Milwaukee.

Discussion led by Lillian Minch, Wisconsin Power & Light Company, Madison.

Address—"What the Farm Housewife Is Doing with Electricity"—Vera B. Meacham, Wisconsin Power & Light Company, Madison.

Discussion led by Mildred Manley, Wisconsin Power & Light Co., Lake Geneva.

Trip through the Public Service Building, Milwaukee, featuring electrical Home. Merchandise, Store, Home Service Department, Customers' Hall, Machine, Accounting and Educational Departments. (Property of The Milwaukee Electric Railway & Light Company.)

6.30—Annual Dinner

Entertainment program arranged by the Local Arrangements Committee with the cooperation of the various member company delegates. The program included skits, musical numbers and other entertainment features.

M. H. Frank, Vice-President of the Association (with the Wisconsin Power and Light Company) presided at the dinner.

Friday Morning, Sept. 20, 1929

Address — "The Utility Spirit" — Helen Welsh, Northern States Power Company, Eau Claire.

President's Message—G. W. Van Derzee, President, Wisconsin Utilities Association (with The Milwaukee Electric Railway & Light Company).

Address—"Tales of Mystery and Imagination"—Vera B. Ellwood, The Milwaukee Electric Railway & Light Company.

Address — "Employees' Training Programs"—Monica Guenther, Wisconsin Public Service Corporation, Milwaukee.

Four-Minute talks on the general subject "The Opportunity in My Job for Serving the Public."

Switchboard—Esther M. Tietz, Switchboard Operator, The Milwaukee Electric Railway & Light Company.

Merchandising—Leila Nicla, Wisconsin Power & Light Company, Sheboygan.

Cashier—Grace LaFleur, Wisconsin Power & Light Company, Beaver Dam.

Report of Judges of Women's Contest—May S. Fletemeyer, Northern Indiana Public Service Company, Hammond, Indiana.

Friday Afternoon

Address—"Light's Golden Jubilee"—Betty Handel, Madison Gas & Electric Company.

Address—"Romance of Power"—A. A. Engelhard, The Milwaukee Electric Railway and Light Company.

Address—G. C. Neff, Wisconsin Power & Light Company, Madison.

National Women's Committee Meeting

A MEETING of the 1929-30 National Women's Committee was held at the Drake Hotel, Chicago, Sept. 23, with twenty-five of its thirty-one members present.

Reports indicated that Women's Committee work is being carried on with increasing effectiveness in all of the Geographic Divisions of the N. E. L. A., and new committees are being organized.

The committee approved the preparation of an educational program for the use of all Women's Committees, to be published at the earliest possible date.

Home Service Subcommittee

Miss Ada Bessie Swann, chairman, Home Service Subcommittee, reported that plans have been made by her group for a more active program than ever before. It is planned to include in the membership of the Home Service Committee men representatives from the Commercial Section, Public Relations Section and others who will bring to the Home Service activity a viewpoint necessary to its proper growth. A tie-in will be made with the American Home Economics Association.

Miss Swann explained that the Manual on "How to Organize and Operate a Home Service Department in an Electric Public Utility Company," which the committee is compiling, would be ready for distribution within the next few weeks. This will form the ground work for the greater activities of the Home Service Committee for 1929-30. Miss Swann told of the plans for developing at N. E. L. A. Headquarters files of material to take care of the requests which come in on many phases of Home Service; first the requests that come from executives wishing to organize Home Service Departments, and, second, requests from departments already organized, seeking assistance in preparing programs, etc. Home Service Tales, the publication of the Home Service Committee, will be continued this year, and will attempt to include more items of assistance to Home Service Directors. A series of articles on Home Service will be prepared for publication in various magazines of the industry. These articles will attempt to bring to the attention of executives within the industry the real purpose of Home Service and the benefits to be derived therefrom. Emphasis will be laid this year on developing programs of Home Service which will bring out all the uses of electricity in the home. Miss Swann said that conferences of Home Service Directors will be held in various parts of the country.

Manufacturers Subcommittee

Miss Frances Weedman, chairman, reported that the plans of the Manufacturers Committee are:

1. To assemble educational material on electric household equipment in the form of a display which will be used in connection with N. E. L. A. conventions and meetings. It will not be sent to individual companies. A list of the material contained in the display will be distributed from Headquarters.
2. To cooperate in the projects of the Women's Committee educational and Home Service groups by furnishing displays, bibliographies and lecturers and demonstrators. Details to be announced.
3. To compile special study sheets on various appliances, to be used for educational studies, short courses, etc.
4. To compile a glossary of electrical household equipment terms. This work will be done under the direction of the Manufacturers Subcommittee, with the assistance of Women's Committee, Home Service, trade magazines, National Electrical Manufacturers Association and National Electric Light Association Headquarters' representatives.

Safety Subcommittee

Miss Esther Rockey, chairman, Safety Subcommittee, reported that suggestions for Safety and First Aid activities for Women's Committees would be prepared for publication in the general Women's Committee educational program, and would be supplemented with suggestions by letter during the year. She urged the organization of Safety

(*Continued on page 756*)

RELATED and other ORGANIZATIONS

Power Group, Metropolitan Section of the A. I. E. E. Announces Program for the Year

MR. G. E. SUTHERLAND, Chairman of the Power Group of the Metropolitan Section of the A. I. E. E., has announced the following program of meetings for this season:

October 30—Generation and Development of Generators.

December 9—Systems Connections.

March 11—High Tension Transmission Cable.

May 13—High Tension Overhead Transmission.

Four groups—namely, Power, Illumination, Transportation and Communication—were organized last year for the purpose of affording young engineers an opportunity to take an active part in the proceedings of the Institute. It was felt that such groups would fill an important gap between the student groups and the senior organization.

At the regular meetings, due to the number of subjects discussed and the limited time available, it is seldom possible for the younger engineers to enter into the discussion.

From the date of its organization the Power group was immediately popular, as evidenced by the large attendance at the two meetings held, and it is hoped that the present program will result in increased participation by the younger men in the Metropolitan district.

New Officers for National Electrical Manufacturers Assn.

NEW officers were elected, a new managing director appointed and six trade practice conferences—the first in the electrical industry—were held under the auspices of the Federal Trade Commission during the third annual meeting of the National Electrical Manufacturers Association at the Wardman Park Hotel, Washington, D. C., the week of October 7.

Clarence L. Collens, president of the Reliance Electric & Engineering Company of Cleveland, was elected to succeed Huntington B. Crouse as president of the Association.

A. W. Berresford, president of the American Engineering Council, past president of the Associated Manufacturers of Electrical Supplies, Electrical Manufacturers Club and the American Institute of Electrical Engineers, was appointed Managing Director of N.E.M.A., effective at once, to succeed Alfred E. Waller, resigned. Mr. Berresford was formerly vice-president and general manager of the Cutler-Hammer Mfg. Co. and vice-president of what is now the Kelvinator Corporation.

After accepting Mr. Waller's resignation, resolutions of appreciation for what he had accomplished with N. E. M. A. were adopted and ordered spread on the minutes.

A. E. R. A. Convention

AWARD of the Charles A. Coffin electric railway medal to the Chicago, South Shore & South Bend Railroad was announced at the annual convention of the American Electric Railway Association, held at Atlantic City, N. J., Oct. 1-4. In marked contrast with many other once prosperous electric railways, hard hit by the ever-increasing use of buses and private automobiles, the South Shore line, after adopting the most modern equipment, showed in 1928 an increase in passengers carried of 8½ per cent over 1927 and 24 per cent over 1924.

Charles Gordon, the new managing director of the association, dwelt on the necessity of protecting both investors in electric railway securities and the communities served by them through putting the companies on a sound financial basis.

The usual great attendance characterized the meeting, of which one feature was international talking motion pictures. Those presented were: Secretary of Commerce Lamont, Lord Ashfield, head of the London Underground Railways; Ernest Reuter, head of the Berlin Street Railways, and Andrew W. Robertson, chairman of the board of the Westinghouse Electric & Manufacturing Company.

Paul Shoup, executive vice-president Southern Pacific Company, San Francisco, was elected president. The 1930 meeting will be held in that city.

New Standard Announced for Flexible Cord

ANNOUNCEMENT has been made by the Flexible Cord Group of the National Electrical Manufacturers Association of a new standard which will greatly increase the mechanical strength and improve the serviceability of flexible cord.

The new specification—which becomes effective Jan. 1, 1930, and after which no cord not fully complying with it will be labeled by the Underwriters' Laboratories—reads as follows:

"All dry braids, both individual and overall, shall be braided of cotton, rayon or silk in such a manner as to result in all adjacent individual parallel threads *actually touching each other,* and shall show no visible open spaces, when observed through a standard braid counter." It is also stated that cords complying with the National Electrical Code can be identified by the following points:

1. The parallel threads of all braids must touch when viewed under an ordinary single lens pocket magnifying glass.
2. The rubber covering must be tough and stretchy, similar to that on a good grade of code wire, and of the required thickness.
3. The copper conductors must either be tinned or protected by a fibrous covering to prevent corrosion.
4. The minimum copper size for a standard cord is No. 18 AWG, usually made up of sixteen strands of No. 30 AWG.
5. All Underwriters' Laboratories standard cords contain manufacturers' identifying marker threads as required by code and as given in Underwriters' List of Inspected Electric Appliances.
6. Underwriters' labels further identify Underwriters' Laboratories standard cords.

National Safety Council Congress

FOUR papers, making up a symposium on "Protection of the Public," were perhaps the high spot reached in the program of the Public Utilities Section of the National Safety Council's annual congress, held at Chicago, Oct. 1-4. The viewpoints were respectively those of telephone and telegraph, transportation, gas and electric utilities. The light and power paper, by W. Briley Wright, of the Eastern Shore Public Service Company, Salisbury, Md., contained a thought that sometimes appears to be lost sight of by utility men working in the streets. This is that utilities use public property by sufferance only, whereas citizens use public property as a common-law right; therefore the burden of caution is definitely on the utilities.

An excellent paper, well illustrated, with slides, on the safe handling of poles was presented by C. S. Holloway of the Illinois Bell Telephone Company. This paper was a virtual compendium of the subject.

Another outstanding contribution was from E. C. Stone, former chairman of the Engineering National Section, N.E.L.A. Mr. Stone contended that the safety standard set by industry is far higher than the safety standard which the people as a whole set for themselves and that industry has shown a consistent and marked improvement in its accident record over the period for which records are available.

WHAT OCCURRED LAST MONTH

Agricultural

More than 52,000 farms in New York State will be using electric central station service and approximately 14,500 miles of rural distribution lines will have been built by electric utility companies before the end of the present year, according to a survey by the New York State Committee on Public Utility Information.

* * *

Canadian Output of Electricity

A report issued by the Dominion Bureau of Statistics shows that during August the output of electric power companies in Canada totaled 1,444,314,000 kw-hr., against 1,410,709,000 in July, and 1,313,556,000 in August, 1928. For the first eight months of 1929 the output was 11,422,244,000 kw-hr., against 10,308,118,000 in 1928.

* * *

Colorado River Project

At a conference in Washington, October 14, a tentative plan for operation of the facilities of Boulder Dam by the United States Government and prospective lessees was submitted to representatives of the lessees. Secretary of the Interior Wilbur, in explaining the plan, said that there was nothing final about it, but that it would serve as a starting point. The plan calls for building of the dam, outlet works, power tunnels and power plant by the government, while the lessees install the machinery and equipment in the power plant and provide the necessary switching, transforming and transmission facilities. The tentative plan fixed the rate for current at 1.63 mills per kw-hr., with provision for readjustment at the end of fifteen years from the date of execution of the contract.

* * *

On October 21, Secretary of the Interior Wilbur announced definite decision regarding the allocation of power to be generated at Boulder Dam, and prospective lessees have been advised that any objections will be formally considered at a hearing on Nov. 12. Subject to certain deductions which may arise through the exercise of preference-rights, the power will be divided as follows: To the Metropolitan Water District of Southern California, 50 per cent, or so much thereof as may be needed and used for the pumping of Colorado River water; to the city of Los Angeles, 25 per cent; to the Southern California Edison Company and associated companies, 25 per cent. The deductions which may arise through the exercise of preference-rights would be caused by the States of Nevada and Arizona claiming allotments which are provided for them. Should the 50 per cent allocated to the Metropolitan Water District be not required for pumping, 66 2/3 per cent of this will be available to the city of Los Angeles and 33 1/3 per cent to the Southern California Edison and associated companies. There are provisions for municipalities which may desire power. A Board of Control is to be set up by the agencies receiving the power.

* * *

Consolidations

It was announced on October 1st that the Standard Oil Company of California had acquired from A. E. Fitkin & Company the Pacific Public Service Corporation. The company serves gas and electricity to a large territory just south of San Francisco and has water and ice services in Los Angeles, San Diego and other communities.

* * *

The Cambridge, Mass., Gas Light Company has asked the State Department of Public Utilities to approve its plan to take over the Cambridge Electric Light Company.

* * *

The American Commonwealths Power Corporation has announced the acquisition of the Interstate Fuel and Light Company which controls the Michigan Fuel and Light Company, distributor of manufactured gas to fourteen communities in Michigan and Wisconsin.

* * *

The New Bedford, Mass., Gas and Edison Light Company has announced the sale of the majority of its capital stock to the New England Gas & Electric Association, part of the Associated Gas & Electric System.

* * *

Dispatches from Montreal tell of an offer being made by the Canada Power and Paper Company to stockholders of the Wayagamack Pulp and Paper Company and the Port Pulp and Paper Corporation for an exchange of stock which would result in absorption of those two companies by the Canada Power and Paper Corporation. The total assets of the merged companies would be about $178,000,000.

* * *

The Southern Public Utilities Company, subsidiary of the Duke Power Company, has purchased the holdings of the Brevard Light and Power Company and the distribution lines of the Cascade Power Company.

Reports from Memphis are to the effect that the Alabama and Tennessee electric power and light properties of the Southern Cities Utilities Company will be acquired by the Commonwealth and Southern Corporation, or its subsidiary, the Southeastern Power and Light Company.

* * *

Announcement of the purchase by the Central Public Service Corporation of three utility properties held by the Dawes interests is said to mark the withdrawal of those interests from public utility fields. The Seattle Lighting Company, The Central Indiana Gas Company and the New York and Richmond Gas Company are the properties purchased.

* * *

On October 15, the American Commonwealths Power Corporation announced plans for acquisition of the following public utility companies: The Ramapo Gas Corporation, operating in Rockland County, New York; the Interstate Fuel and Light Company, serving a group of cities in Indiana and Michigan; the Vermont Lighting Corporation, supplying gas to several Vermont cities; the St. Johnsbury, Vt., Gas Company; the Ware, Mass., Gas Company, and the North Attleboro, Mass., Gas Light Company.

* * *

A petition filed with the New Hampshire Public Service Commission asks for approval of the purchase by the Central Vermont Public Service Corporation of assets of the Vermont Hydro-Electric Corporation, the Bradford, Vt., Electric Light Company, and the Windsor, Vt., Electric Light Company.

* * *

The Pacific Gas and Electric Company has asked the California Railroad Commission for permission to acquire 4580 out of 10,000 shares of the common stock of the Vallejo Electric Light and Power Company.

* * *

On October 22, the Middle West Utilities Company announced consummation of plans for acquisition of the properties of the United Public Service Company. The Middle West will acquire the common stock of the United company. United Public Service Company's properties supply service to 240 communities in Kentucky, Ohio, Indiana, North Dakota, South Dakota, Arkansas, Texas, Louisiana, Mississippi, Tennessee and Alabama.

* * *

Earnings of Public Utilities

The Department of Commerce announces that gross earnings of public utility enterprises in August, exclusive of telephone and telegraph companies, as reported by 95 companies or systems operating gas, electric light, heat, power, traction and water services, were $179,500,000, as compared with $178,000,000 in July, 1929, and $173,952,469 in August, 1928. Gross earnings for the first eight months of 1929 were $651,000,000, as compared with $554,432,512 for the corresponding period of 1928.

* * *

Federal Trade Commission's Investigation

On October 3, at a hearing held by the Federal Trade Commission in Washington, several witnesses were questioned concerning an alleged memorandum circulated in August by Laurence Todd, a Washington correspondent, and claimed by Mr. Todd to have been written by some one connected with the utilities. The document dealt with accounting practices of the Federal Power Commission. Witnesses questioned by Colonel William T. Chantland, Assistant Chief Counsel of the Trade Commission, were Paul S. Clapp, managing director of the N.E.L.A., Paul A. Schoellkopf, president of the Niagara Falls Power Company, and M. O. Leighton, of Washington, D. C. These witnesses declared that they knew nothing of the memorandum. Mr. Clapp testified that he had made an investigation but had not been able to discover the author of the document. Mr. Todd, Washington correspondent of the Telegraph Agency of the Soviet Union, who circulated the memorandum, was not examined.

Colonel Chantland conducted the examinations because of the illness of Judge Robert E. Healy. At the conclusion of the hearing, Chairman McCulloch announced that further hearings would be postponed for several weeks due to Judge Healy's illness. He also said that examination of witnesses by representatives of the utilities is likely to be the first order of business when hearings are resumed.

* * *

The seventeenth monthly interim report to the Senate on the Federal Trade Commission's utilities inquiry was made public October 16. In this the Commission says that delay of some large holding company groups in returning questionnaires and submitting records relating to mergers and other financial transactions is slowing up financial phases of the investigation. Offices of twelve electric and gas companies in various parts of the country have been visited in the last three months by the Commission's examiners seeking to develop facts with respect to the growth of capital assets and capital liabilities and the costs of the charges of service companies, the report declares. It says that the Commission needs additional accountants if the investigation is to be carried on expeditiously.

* * *

Foreign

A London dispatch says that the Southern Railway Company announces its decision to begin electrification of its main line from London to Brighton, a distance of 51 miles. Branches constituting an additional eleven miles will also be electrified.

* * *

Hydro-Electric

Fifty potential dam sites for the development of hydro-electric power have been located in the Potomac River Basin above tidewater as the result of the season's work conducted by field parties under the direction of Major Somervell, District Engineer for the War Department in the Washington area.

* * *

The Bureau of Reclamation announces that the rural electrification program of the Salt River, Arizona, reclamation project is practically complete. Electricity is now available at every one of the 7000 farms on the project.

* * *

Twenty applications for permits, or licenses, under the Federal Power Act, were filed with the Federal Power Commission during the quarter from June 30 to September 30. These involved approximately 127,120 primary horsepower.

* * *

The three Cabinet members of the Federal Power Commission—Secretary of War Good, Secretary of the Interior Wilbur and Secretary of Agriculture Hyde—have made an inspection trip of Cumberland Falls and the surrounding district as part of their consideration of the application of the Cumberland Hydro-Electric Power Company for permission to erect a power plant at the Falls. Secretary Good, in an interview on October 14, said that the Federal Power Commission was trying to determine the legal status of the Cumberland Falls question. So far, he said, it would appear that the Commission is practically compelled to grant the requested permit. The Commission found that in the territory around the Falls nearly everyone was in favor of the hydro-electric development. He also said that the Governor of Kentucky is in favor of it, but that a certain percentage of people in other parts of the State want the Falls preserved in their natural condition.

* * *

Secretary Wilbur on October 12 declared that regulation of all inland water affecting the national life should be centered in a government agency, as the effects of water-storage on flood control, reclamation, irrigation and consumption by communities cannot be adequately considered by a competent regulating agency under present statutes. Although he does not approve the present structure of the Power Commission, Mr. Wilbur is not ready to advance a substitute plan.

* * *

It was announced on October 16 that directors of the Pennsylvania Water and Power Company are to take action leading to construction of a $30,000,000 hydro-electric development at Safe Harbor, Pa., on the Susquehanna River. The development will be carried out by a separate corporation to be known as the Safe Harbor Water Power Corporation, but this will be directed by the same management as the Pennsylvania Water and Power Company. The initial development at Safe Harbor will have a total capacity of about 230,000 hp., and an ultimate capacity of over 500,000 is planned.

* * *

On October 16, the Federal Power Commission granted to the Gasconade River Power Company of Kansas City, Mo., a preliminary permit for two years on a proposal to install a plant of 12,000 hp. on the Gasconade River; to J. N. McDonald, Sarasota, Fla., a preliminary permit for two years for a 16,000 hp. project on the Oklawaha River; to the Inland Power and Light Company of Portland, Ore., a license for a plant on the Lewis River, with initial installation of 54,000 hp. and ultimate installation of 216,000 hp.; to the Washington Electric Company of Seattle a license to install a plant on the Columbia River, near Wenatchee, pursuant to a preliminary permit issued Sept. 3, with initial installation of 84,000 hp. and ultimate installation of 210,000 hp. The licenses call for protection of navigation, irrigation and fisheries. The Commission also granted a license to the city of Hyrum, Utah, for a 600 hp. project on Blacksmith Fork.

* * *

A dispatch from Toronto says that the Ontario Hydro-Electric Power Commission has secured power rights at Chats Falls.

* * *

Attorney-General Ward of New York State, in an address on October 18 to the New York State Waterways Association, declared that he was not in accord with the Conservation Department of the State in its policy of laying large taxation on water users for the benefit of the State as a whole. It is his position that the opportunity to develop cheap power is a local or geographical advantage and that it is unfair to spread the benefits of the situation through heavy State taxation.

* * *

Land has been acquired by the Virginia Public Service Corporation for the construction at Greaver's Mill on the Jackson River in western Virginia of a new hydro-electric unit costing $2,000,000 and capable of developing 100,000 hp.

* * *

Paper Company Sells Newspaper Interests

Dispatches from Boston say that the International Paper Company is now virtually out of the newspaper field, its only remaining interest being in the Augusta, (Ga.) *Chronicle* and three associated newspapers.

* * *

Municipal Plants

Portland, Ore., has appropriated $25,000 to finance a study of municipally-owned electric utilities.

* * *

Although a majority of the voters of Bayport, Minn., on Sept. 30 voted to sell the town's electric distribution system, the project was defeated because the required two-thirds favorable vote was not cast.

* * *

Municipal Ownership

The change from private to municipal ownership and from municipal to private ownership of public utilities is discussed in "The Changing Character and Extent of Municipal Ownership in the Electric Light and Power Industry," a monograph by Herbert B. Dorau, just published under the auspices of the Institute for Research in Land Economics and Public Utilities. Copies may be secured by addressing Dr. Richard T. Ely, editor of the *Institute,* Chicago. The price is $1.50 per copy.

* * *

Muscle Shoals

In response to a letter written by Senator Heflin urging that Henry Ford again interest himself in Muscle Shoals, Mr. Ford's secretary has written to the Senator saying that he has been advised to say that Mr. Ford has no plans at this time whereby the power at Muscle Shoals could be utilized and that it would be outside the question for Mr. Ford to make an offer again. The letter further says that Mr. Ford has suggested that other interests are in a better position to develop and utilize the power.

* * *

On October 4, Senator Black of Alabama, addressing the Senate, declared that between now and January something ought to be done with respect to Muscle Shoals in order "to relieve the Southern farmers from servitude to the foreign control of nitrate production."

* * *

An article by Senator Capper in the New York *Herald Tribune* and the *Washington Star,* October 6, advocates use of Muscle Shoals for fertilizer production and declares that the prospect of too much electric power, rather than any lack of power, is considered by power companies of the Southern Appalachian region.

* * *

New York State Inquiry

The Special Investigating Commission, appointed by the Governor and Legislature of New York, composed of six Republican legislators and three appointees of Governor Roosevelt, with Col. William J. Donovan as counsel, began its hearings in New York City on October 9. William A. Prendergast, chairman of the Public Service Commission of New York State, was the first witness. He gave an account of the workings of the Public Service Commission, mentioning that the Commission disposes of 949 formal cases and 11,632 informal cases yearly on the average. He outlined suggestions for enlarging the powers of the Commission to include greater regulation of motor bus operation and aircraft service. He stated that the Commission is handicapped by a lack of personnel and facilities. Professor Bonbright, a member of the Investigating Commission, offered a resolution calling on members of the Commission to file with the secretary all connections, direct or indirect, which each may now have or formerly had with utilities.

* * *

The Special Investigating Commission continued its hearings on October 10, 11 and 16. William A. Prendergast, chairman of the Public Service Commission of New York State, continuing his testimony, suggested that the Public Service Commission should be given more jurisdiction over the submetering situation in New York State, told of the Public Service Commission's jurisdiction over certain railway matters and the growing demands upon its time and resources made by the increase in motor buses. He spoke of the difficulty in getting large appropriations from the Legislature for the increasing work of the Commission. He also testified that in the past certain electric companies of New York State showed a rate of return as high as 11 and 13 per cent on the basis of their book values, but declared that most of these have since made reductions. He also stated that among the 8558 orders issued by the Public Service Commission, only 46 had been taken to court and only 10 had been reversed. In his testimony on the 16th, Mr. Prendergast advocated that the Public Service Commission be given complete authority over holding companies which control any utility corporation over which the Commission has authority.

* * *

Production of Electricity

The Geological Survey of the Department of the Interior announces that a new record in the production of electricity by public utility power plants was set during the month of August. The total of kilowatt-hours produced was 8,259,000,000. The greatest figure hitherto, in January, 1929, was 8,241-000,000.

* * *

Railway Electrification

An announcement made by officials of the Pennsylvania Railway on October 22 says that complete electrification of the Pennsylvania from New York to Washington, including the Baltimore tunnels, is now in sight as the result of an agreement reached between the company and the city of Baltimore.

* * *

Rates

The Arkansas Power and Light Company announced on Sept. 25 that more than $600,000 per year will be saved by 60,000 domestic and commercial customers of the company in 170 communities under new rates approved by the Board of Directors. The new schedule will become effective Jan. 1.

* * *

A new schedule of rates offered by the Utica, N. Y., Gas and Electric Company has been accepted by the Common Council and approved by the Mayor. It is estimated that the new rates will save about $220,000 annually to consumers.

* * *

The Houston, Tex., City Council has passed an ordinance embodying a new schedule of electric rates offered by the Houston Lighting and Power Company, which, it is expected, will result in an annual saving to consumers of $250,000. A profit-sharing agreement now in effect between the city and the company continues in force.

* * *

The Fairbury, Neb., City Council has announced a reduced rate for towns of Reynolds and Gilead.

* * *

The Monongahela West Penn Public Service Company, having acquired the electric property of the Richwood, W. Va., Light and Water Company, announces that rates for the district served by the acquired company will be reduced to conform with its general rates for domestic and commercial consumers.

The Northern States Power Company announced on Oct. 9 that it had arranged for a further reduction of rates, amounting to approximately $1,250,000 annually to consumers in the Central Northwest territory served by the company. The reductions will apply to 400 cities, towns and villages. In most of these, all classes of customers will benefit. In Minneapolis and St. Paul, which received a large reduction in 1928, residential rates will not be reduced, but rates for commercial lighting and small power will be cut substantially.

* * *

The Consolidated Gas and Electric Company of Baltimore has accepted a ruling by the Public Service Commission of Maryland which means a reduction of about $1,300,000 per annum for electricity and gas in the territories served.

* * *

A voluntary electric rate reduction schedule filed by the Kansas City Power and Light Company, affecting Kansas City and 37 towns, will mean a saving to electric customers estimated at $400,000 a year. The schedule has been approved by the Missouri Public Service Commission.

* * *

The Commission of Public Works of Hudson, Mass., announces a reduction of about 15 per cent in electric lighting rates for the towns of Hudson and Stow. The initial rate in Hudson will be 7½ cents and in Stow 8½. The secondary rate will be 3½.

* * *

The Portland, Ore., Electric Power Company on Oct. 12 announced a reduction of 20 per cent in all industrial power schedules. This means a cash saving to customers of about $500,000 a year. The new rates go into effect Dec. 1.

* * *

The North Adams, Mass., Gas Light Company, which supplies gas and electricity for Adams, North Adams and Williamstown, announces a reduction in its electric schedules which will save consumers $20,000 a year. The Cape and Vineyard Electrical Company announces lower rates for the towns of Bourne and Sandwich, Mass. New and lower rates for Lowell, Mass., were announced Oct. 17.

* * *

A reduction of about $30,000 a year in rates for Fort Dodge, Iowa, served by the Fort Dodge Gas and Electric Company, is announced.

* * *

The Keystone Public Service Company of Oil City, Pa., has announced reductions in residential rates in Oil City, Franklin, Titusville and surrounding territory. The annual saving to consumers will be $41,000.

* * *

Regulation

Senator Couzens, who is chairman of the subcommittee investigating interstate communications and power, has announced that legal phases of the investigation will be handled by William C. Green of St. Paul, former Assistant Federal Attorney at Fargo, N. D.

* * *

On Oct. 11, the Department of Public Utilities of Massachusetts handed down a decision denying the request of The Edison Electric Illuminating Company of Boston to split its stock, 4 for 1, changing the par value from $100 to $25.

* * *

The special commission, created by the recent session of the Massachusetts Legislature to study the power situation in the state, announces that questionnaires are being sent to 111 gas or electric operating companies and 203 investment trusts.

* * *

Opposition to the Couzens bill which would create a federal commission on communications and power is set forth by the State Corporation Commission of New Mexico in a protest just sent to the members of the New Mexico delegation in Congress. The protest calls the bill an attack on state rights.

* * *

St. Lawrence Project

"New England and the St. Lawrence Seaway" is the title of a book by Henry I. Harriman, president of the Boston Chamber of Commerce, which has recently been published. This is a strong argument in favor of the St. Lawrence project from the point of view of New England.

* * *

On Oct. 2, 3 and 4, hearings were held in Washington by Special Master Charles Evans Hughes in the case of the states of Wisconsin, Michigan, Minnesota, New York, Ohio and Pennsylvania, against the Sanitary District of Chicago, in the matter of diversion of water from Lake Michigan by the Sanitary District.

* * *

In an address at Louisville, Ky., Oct. 23, President Hoover reiterated his support of the St. Lawrence project, saying that this country should undertake to do its part whenever Canada has overcome its difficulties. He said that, after disposing of the electrical power, the entire waterway construction could be contracted for less than $200,000,000.

* * *

A dispatch from Montreal tells of commencement of the work for development of the St. Lawrence River by the Beauharnois Light, Heat & Power Company. The project calls for developing 2,000,000 horsepower and provides 30-ft. depth navigation between Lake St. Francis and Lake St. Louis.

* * *

Subway Contract Awarded

On Sept. 27, the City of New York awarded to The New York Edison Company the contract for supplying current for the new city-owned subways. The price is to be 7.99 mills per kw-hr.

* * *

Water Power

A recommendation that water power problems in New York State be removed from politics and placed in the hands of representatives of unbiased business interests, was made Tuesday Oct. 22, in a report of the committee of twenty-five, which was appointed last April by the New York State-wide Economic Conference, with the object of stemming the migration of industries from the State.

Great Lakes Division Commercial Conference Jan. 20-22

ON Jan. 20-22, at the Edgewater Beach Hotel, Chicago, the Great Lakes Division will hold a Commercial Conference. On Monday there will be a meeting of the Power Club and on Tuesday and Wednesday there will be a Merchandising Conference. On the same days an Electrical Advertising School will be held.

Details of the Programs will be published in a later issue of the BULLETIN.

Correction

MR. FRANK A. WARDLAW, Secretary of the Edison Pioneers, has called the attention of the Editor to a mistake in the caption of the illustration on page 632 of the October number of the BULLETIN. It gives the impression that the original Edison incandescent lamp was first demonstrated to the public on October 21st, 1879. As a matter of fact, the first public demonstration did not occur until December of that year. The lamp pictured was the one used in the demonstration on December, 1879, and not on October 21st, 1879, as the caption indicates. On October 21st, Mr. Edison turned on the current into the first practical incandescent lamp. It burned steadily for forty hours. He announced his invention and demonstrated it to the public December 21st, 1879.

LEGAL DECISIONS from RATE RESEARCH

EDITOR'S NOTE: *Rate Research*, which is published weekly by the Rate Research Committee of the National Electric Light Association, sets forth those decisions of various courts and Public Service Commissions which are of immediate interest to the light and power industry. It does not attempt to publish all such decisions. Decisions not directly connected with the industry are often published if, in the opinion of the editors, the principles involved are of importance.

It is believed that the publication, from month to month, of comments upon some of the leading cases, free from legal phraseology, will be useful. Public utility law is comparatively new, and everyone connected with public service enterprises should have an understanding of the trend and significance of these commission and court decisions.

For these reasons the N. E. L. A. BULLETIN will carry each month brief comments on some of the leading cases reported by *Rate Research* as coming before either State or Federal courts or Public Service Commissions.

Principles Involved in Suits for Negligence

THE law recognizes electricity of high voltage as an element of very great potential danger to life and property and imposes upon persons engaged in its generation and transmission the duty to use a degree of care, diligence and foresight in proportion to the danger involved. The United States Circuit Court of Appeals, Fourth Circuit (Dunagan v. Appalachian Power Company, 35 *Rate Research* 261), has just approved the above statement of law and also approved a statement that the duty referred to requires:

(1) The installation and use of such devices and safeguards as are in established and practical use in the business for the protection of life and property.

(2) The exercise of reasonable care commensurate with the danger in maintaining such devices.

(3) Thorough inspection of the devices and equipment at such times as reasonable care in view of the danger may require.

(4) That the employees in charge of the operation of the devices and equipment are to use reasonable care in the discovery of dangerous conditions and immediately use reasonable caution to prevent injury.

If, however, the power company's lines are properly constructed of proper materials, properly inspected in accordance with the practice in such cases usually followed by those engaged in the business; if the power house is properly equipped with the usual modern appliances known in practical use, and if the power company within a reasonable time after such appliances indicate trouble, take reasonably prudent steps to remedy the same, the power company cannot be held liable for injury.

The Constitutional Debt Limit of Municipalities

THE question of when a municipality has incurred indebtedness within the constitutional provision limiting the amount of indebtedness which a municipality may incur, has arisen in several western and southern States in the last few years. To the ordinary layman, at least, these decisions do not seem to be entirely consistent, and it may be said that there is a conflict on the subject. Of late, the question has arisen in connection with the building of a municipal light and power plant where the city has contracted that the amount to be paid therefor shall be paid out of a special fund created by the city from the product or service of the plant. The Utah Supreme Court (Barnes v. Lehi City, 35 *Rate Research* 266) has just held that such contract has not created an indebtedness within the meaning of the Utah constitution. In this respect it follows the Supreme Court of the State of Washington and also of the State of Colorado. The case gives a fairly good reference to decisions by other courts. In this case, as in several others, Fairbanks, Morse & Company had made the installation. The extent to which Fairbanks, Morse & Company have proceeded along these lines in other States, can be gathered from the decision in the case of Fairbanks, Morse & Company v. Texas Power & Light Company, decided by the United States Circuit Court of Appeals, Fifth Circuit (35 *Rate Research* 215).

Charge for Connection and Disconnection for the Short Term Users

THE New Jersey Board of Public Utility Commissioners has upheld a rule providing that when the current is supplied for a period of six months or less there shall be a charge of $3 when the connection or disconnections of wires or meters is necessary. The Commission finds that the costs of supplying service readily fall into three general classes, two of which are fixed and one variable. These are: (1) customer charges varying roughly with the number of consumers; (2) the element of cost of service depending upon the proportion of plant and distribution system which the company must maintain or hold in reserve for each customer; (3) the element of cost depends upon and varies with the actual amount of electricity consumed.

The Commission then finds that all year round customers generally bear their due costs for all three classes, but seasonal customers frequently do not do so and entail larger costs, for instance, in more frequent connection and disconnection. They held it reasonable that the electric utility should segregate these short term customers and impose a proper charge for connection and disconnection (35 *Rate Research* 227).

It Does Not Pay to Steal Electricity in New Hampshire

A MAN named Rousten was in the bakery business at Manchester. He was charged under a statute of New Hampshire, which makes it a punishable offense for any person wantonly and maliciously to prevent an electric meter from duly registering the amount of electricity supplied, or causing it to be done. In this case a short wire called a "jumper" had been attached to the outside wires of the meter, thus diverting the current. The conviction was sustained by the Supreme Court of New Hampshire, State v. Rousten (35 *Rate Research* 217).

The Boston Edison Case

IT is not often that any commission hands down a decision which has received such a general discussion as that of Massachusetts Department of Public Utilities in the matter of the application of the Boston Electric Illuminating Company to change the par value of its $100 stock into $25 stock, a privilege which has been granted forty-five other companies in Massachusetts (35 *Rate Research* 299).

In rendering the decision, the Commission took occasion to criticize the price being paid for the stock of the company on the Boston Stock Exchange where it has been listed for a great many years.

The decision involves a great many interesting points, and not the least interesting of them is the question of how far commission jurisdiction can or should go; whether the peculiar system of regulating public utilities in Massachusetts is preferable to that which exists in all other States.

For those interested in the discussion of some of these subjects, reference is made to the current *Public Utilities Fortnightly*.

A UNIQUE RATE SCHEDULE

According to *The Round Table* the following rate schedule appears upon the bills of a municipally owned plant in Tennessee:

RULES: Lights on the sliding scale. Places of business, $2.00 the month, with 12 watts to go, 8 watts at 12½c. and 30 watts at 10c., above 50 watts at 8c. Net due on the first of each month, and a 25c. penalty for failure to pay ere the 10th. Residences, minimum $1.50 with 12 watts to go, and otherwise same as above.

Cooking Food by Electrocution

ELECTROCUTING steaks, chops, roasts, potatoes, and, perhaps, eventually the lowly "hot dog," instead of using ovens or broilers for cooking, is the latest idea to be sprung on the tired business man by the home economics experts whose job it is to show the housewife how to beat the "dinner in town with a friend" or the night club game with home cooked dinners.

The new scheme of cooking is a product of the Iowa State College household equipment staff, and is an invention of Miss Lenore Sater. The device, in its present stage, consists of an ordinary glass jar with a steel plate in the bottom forming one electrode. The other electrode is a steel plated plunger which is placed in the jar—and there you are. Place in the jar meat, vegetables or whatever you want to cook, throw the switch and, as is said in the best of home economic circles, "that's that."

According to Miss Sater, the idea originated in Germany by placing two electrodes in a potato and passing an electric current through it.

"Black Streets Are Back Streets"

THE Newspaper Advertising Copy Service, issued each month by the National Electric Light Association for the benefit of member companies, contains, for November, an advertisement calling attention to the benefits of a well-lighted store and a well-lighted, well-dressed shop window. Now comes Dr. Julius Klein, formerly Director of the Bureau of Foreign and Domestic Commerce and now Assistant Secretary of Commerce, emphasizing the importance of effective lighting as an aid to merchants, in a speech before the Broadway Association, New York. "In the present era of well-lighted shops," he says, "dinginess may be disastrous. At least, it is suspect. Gloom in a store often hides more than the stock. It may cloak bad features in arrangement and in sanitation."

Dr. Klein cited two experiments made by the Pacific Coast Electrical Association. In two poorly lighted establishments, one a jewelry store and the other a confectionery and lunch room, modern lighting equipment was installed. A close check on advertising value and actual business done was made before and after the change.

"Under the old lighting, less than 17 per cent of the passers-by stopped to look into the jewelry store window, but with the good modern lighting the percentage jumped to 70. For the lunchroom, the increase in the advertising value of the brighter windows was from 21 to 52 per cent, by actual count." The jeweler is now spending only $30 more a month for electricity, is getting four times as much advertising value from his windows, and his actual business has increased 27 per cent.

In the West originated the slogan, "Black streets are back streets." The converse is illustrated by Broadway, with its miles of light and its sunburst center at Times Square.

Loss of Electricity Between Power House and Customers' Meters

THE significance of the fact that at least 15 per cent of all of the power generated by central stations throughout the United States is "lost" somewhere between the power house and the customers' meters is little understood. According to the Bureau of the Census, there was available for distribution in the United States during the year 1927 more than 104 billion kilowatt hours, yet according to the figures of the Statistical Research Department of the National Electric Light Association, only a little more than 89 billion reached the ultimate consumers.

This loss in energy during transmission is something which is inherent in the generation and distribution of electricity, and as yet electrical engineers have apparently been unable to overcome it. It means, however, that every central station must be equipped to generate more actual kilowatt hours than it can possibly deliver to its customers and that out of every 100 kw-hr. it generates, an average of at least 15 will disappear, just as in a carload of fruit or vegetables there will be a certain percentage of spoilage in transit.

Or, putting it another way and taking the average for the whole United States, every time a consumer buys 100 kw-hr. there must be generated at the power station 117½ kw-hr. His position is exactly the same as when he goes to the meat market for a five-pound roast. If he buys a five-pound roast he doesn't get five pounds of meat, or, if he wants five pounds of meat, his roast will weigh more than five pounds.

Looking at this situation from the standpoint of rates, if the consumer is paying, for example, 6 cents a kilowatt hour, his bill for 100 kw-hr. is $6. But the company has actually generated for him 117½ kw-hr.—for which it receives $6—and therefore instead of receiving 6 cents for a unit of its product, it actually receives only 5.1 cents.

The Stage Electrician to the Front

AT last the stage electrician has come into his own. No longer must he remain back-stage unseen by the audience, sans honor and sans song. With a new installation for the handling of lighting effects, the Chicago Civic Opera House has brought him out in front alongside the musical director.

In front of the curtain, the lighting operator will control the stage and house lighting as easily and as intelligently as the orchestra conductor now directs the orchestra. In front and on each side of him will be arranged dials, knobs, tumbler switches, indicating lights, etc. By the mere manipulation of a single knob all the complexities of stage lighting will be controlled, lights of various colors fading and brightening at various points and at the proper moments. Scenes requiring complex lighting effects, such as sunset, sudden thunderstorms, ballets, etc., will require no more effort in their control than is required to flick a lighting switch in the home or to turn a door knob.

Modern Equipment Replaces Antiquated Layouts

THE recent placing in operation of a 60,000-hp. hydro-electric plant at Bellows Falls, Vt., by the New England Power Association, furnishes an excellent example of the substitution of modern equipment for antiquated layouts handed down from the past.

Formerly 70 water wheels aggregating 10,000 hp. were at work within a stretch of one-third of a mile. Now three vertical generating units with a new dam and rebuilt canal and with six times the capacity, have taken their place. The development in general consists of a concrete dam with flood control equipment, canal, power house, tail race and outdoor switching stations.

THE REVIEWING STAND

Electrification of Steam Railroads

Report, Electrification of Steam Railroads Committee, N. E. L. A. Publication No. 289-118, 82pp. (illustrated). Price, $1.15; to members, 75 cents.

PROGRESS of railroad electrification in the United States and in foreign countries is covered in this report, the most important feature being the result of an extensive survey of electrified railroads in Europe and the British Isles made by a subcommittee sent abroad for that purpose late in 1928.

While railroad electrification began in this country as early as 1895, the United States had only 1753.32 route miles electrified at the close of 1928. Europe, on the other hand, had practically no electrified mileage prior to 1915 and now has 4996.33 route miles electrified. This is exclusive of Soviet Russia and the British Isles. Great Britain has 1019.12 route miles electrified, Canada 92.16 miles, while the whole of Central and South America combined has only 566.30 miles.

Within the past year three important electrifications have been completed in the United States. The Great Northern Railway finished the installation work in its new Cascade Tunnel and complete electric operation began on Jan. 12, 1929. The Pennsylvania Railroad completed the electrification of a number of additional suburban routes in its Philadelphia district. The Boston, Revere Beach & Lynn Railroad completed the electrification of its narrow gage system.

Two large systems—the Pennsylvania and the Reading—have announced the authorization of large extensions to their electrified lines. The Pennsylvania will electrify its lines from New York to Wilmington, and the Reading will electrify its suburban lines in the vicinity of Philadelphia, intimating probable extensions to New York, Bethlehem and Reading. The Lehigh Valley is reported to be making estimates on the cost of electrifying its main line between Mauch Chunk and Wilkes-Barre, Pa., involving 75 miles of double track. The Delaware, Lackawanna & Western has selected for its suburban electrification near New York 3000-volt direct current with overhead contact, and it is reported that the reason for this is its adaptability to main-line operation in the future.

The subcommittee on electrification in Europe visited England, Netherlands, Sweden, Germany, Switzerland, Italy and France. In addition to visiting most of the steam railroad electrifications in these countries, the rapid transit subways were inspected in London, Berlin and Paris. After describing in detail the railroad electrification in these countries, its report, which is appended to the report of the general committee, presents the following conclusions:

"Electrification has so far been undertaken in definite localities for certain special reasons; electrification will be extended where it now exists and introduced into new districts, for the same compelling reasons; most of the electrification in Europe has come into existence since the war; the establishment of large commercial power systems (both private and State owned) in Europe has also been a post-war development, followed by interconnection of power systems so as to provide large pools of power; recognition of the technical advantages of securing power from the large commercial networks seems quite generally and constantly increasing in effect."

Appended to the general report is the report of a subcommittee "Standard Form of Contract." This committee has been making a study of the contracts used in this country for the sale of energy to electrified railroads and have outlined the desirable features to include in such a contract.—*E. G.*

Electric Rates and Their Status in 1929

Report, Rate Research Committee, N. E. L. A. Publication No. 05, 16pp. (illustrated). Price, 30 cents; to members, 20 cents.

THIS report of the Rate Research Committee deals with the status of electric rates and rate forms in 1929, reviewing historically the changes in forms over a period of years.

Striking evidence of the increasing use of the promotional rate forms for residence service is disclosed, 278 out of 392 large cities now having such rates available, as against 124 in 1922. Comment is given to the three cost components in residence service—demand, customer and energy costs, illustrating the relative minor part of the energy portion. The advantages of various rate forms are considered, but the experience of companies using promotional rate forms indicates that the particular form used for domestic service is not vital. The stimulation of business from reductions in follow-on rates is found to be much greater than from reductions in top rates. The report recommends that the top rates should not under normal conditions be reduced. It is predicted that in the near future rates of straight-line character will be obsolete.

In 127 cities of population of 20,000 or over, power factor adjustments are specified in power rates. In 55 cities the billing is adjusted either up or down, according to whether the power factor is below or above a certain specified percentage. Companies are urged to study the power factor problem with increasing attention. The matter of rural rates becomes relatively simple with a correct solution of the extension problem. The report recommends that rural customers be relieved of direct investment other than their own equipment, that rural rates be as simple as possible, that service or minimum charges be graduated, and that the energy charges be in quick-break block form and free of demand and customer costs to encourage maximum use.

Decisions of commissions and courts in public utility matters during the past year are summarized under headings of valuation, depreciation and reserves, going value, rate of return, rates and service, and taxes on electricity generated.—*C. E. N.*

Power House Cranes

Report, Hydraulic Power Committee, N. E. L. A. Publication No. 01, 12pp. (illustrated). Price, 25 cents; to members, 15 cents.

REQUIREMENTS and type of construction acceptable for cranes used in power houses and substations are outlined in this report, which is based on information on crane design obtained from member companies and crane manufacturers. Construction is recommended which is believed will be satisfactory under the services given and which should permit of the economics of construction with due regard to safety.

Turbines

Report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-98, 96pp. (illustrated). Price, $1.50; to members, $1.00.

THIS year's report presents a summary of the 1926 record of 153 turbines, 1927 record of 186 turbines, and the detail 1928 record up to 207 turbines. The 1928 record shows an increase in the per cent of total time during which the units were available for service. Compared with the 1925 record, the unit outage shows a reduction of approximately 25 per cent.

An investigation of the turbine operating methods disclosed that there is no consistency in the time in which cold machines of equal capacity are brought up to speed and loaded. Neither was there found any definite relation between major turbine troubles and the machine operating methods.

Troubles incident to turbine blading form the greatest single cause of turbine outage. Information is presented which should be helpful in suggesting a method of approach when these troubles are encountered.

The report reflects the tendency to increase the period between inspection, which has been annually for a majority of the operating companies.

Tests on turbo-generator units ranging in capacity from 6000 to 60,000 kw. are included. Statements by operating companies on new installations, special tests and unusual operating experiences are given, along with statements on turbine blading, large steam turbines and turbines used for auxiliary drive. A bibliography concludes the report.—*E. S. B.*

Power Station Chemistry—Part II

Report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-114, 44pp. (illustrated). Price, 75 cents; to members, 50 cents.

THIS report of the Chemists' Subcommittee includes a non-technical review of water treatment for steam generation. As a standard procedure the reporting of water analyses is in ionic form and expressed in parts per million by weight. The reactions involved in water treatment calculations are presented in ionic form, and a procedure is included for calculation of water reagent requirements.

A contributed statement discusses a graphic method of controlling the treatment in a Lime Soda system. An individual member statement on a laboratory study of turbine oil, using a Funk sludging machine, is given.

Approved test methods for judging the quality of turbine oils are presented under Recommended Test Procedures. The tests will serve to establish variations in various shipments of the same trade name of turbine oils, and a selected few will serve in a measure to show the rate of alteration an oil undergoes in service. The tests alone are not suitable for determining the comparative desirability of different brands of new oils for turbine lubricating service.

The report emphasizes the desirability of making tests for the Hydrogen Ion Concentration in water supplies as one of the factors to be considered in the corrosiveness of the water, and statements of the significance of the Hydrogen Ion Concentration have been included both as committee and manufacturers' statements.

Individual members have submitted statements for plant use, one on the graphical estimation of various alkalinities in water, the other, a plant control test for estimating phosphates in boiling water.

A manufacturer's statement on equipment for the electrometric determination of Hydrogen Ion Concentration and direct reading of the conductance of water concludes the report.—*E. S. B.*

Condensing Equipment

Report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-111, 40pp. (illustrated). Price, 55 cents; to members, 35 cents.

THIS report includes a study of performance record of single-pass and two-pass condensers, excessive vibration and condenser leakage, and experience with condensers having tubes rolled into tube sheet at both ends.

Data indicate that the performance of single-pass condensers is somewhat better than that of two-pass. Performance of vertical condensers is appreciably better than horizontal condensers with the same number of passes. Tables included give design and performance data of 15 two-pass and 11 single-pass condensers. The variation of average heat transfer rates with inlet water temperatures is also shown. Excessive condenser leakage resulting from tube vibration has been experienced in some cases, which has been most effectively remedied by the installation of additional tube support sheets by the use of thicker tubes.

Two companies report satisfactory operation with condensers having the tubes rolled into the tube sheet at both ends.—*E. S. B.*

The Changing Character and Extent of Municipal Ownership in the Electric Light and Power Industry

By Herbert B. Dorau, Assistant Professor of Economics, Northwestern University School of Commerce. Published by the Institute for Research, Land Economics & Public Utilities, Chicago. 102 pages. Price, $1.50.

ACCORDING to the author in his preface, this is simply a preliminary report issued at this time in order "to make available, as quickly as possible, the results of an intensive search for facts about the changing extent and changing character of municipal ownership in the electric light and power industry of the United States." This being, as Professor Dorau says, only part of a larger study and interpretation of this most important subject, it is quite evident that he will eventually produce a document which will be of inestimable value not only to the light and power industry, but to every economist in the world.

In his very first sentence the author raises a question which has been puzzling large numbers of intelligent people. He says that in his study he has proceeded on the assumption that "municipal ownership in the electric light and power industry is an understandable and explainable phenomenon." No doubt it is. There probably has been a reason for the development of municipal plants in the past just as there must be a reason for the decline in municipal ownership during the past few years. The author sets out to define the various factors which explain this rise and decline, backing up his statements with an elaborate documentation in the form of statistical tables, charts and graphs, until one must become convinced that, insofar as the economic progress of these United States is concerned, the Marxian philosophy of government ownership and control of essential services is being more or less relegated to the role of a second-hand stage prop for the use of that noisy minority which refuses to have anything to do with the real work of the world.

Professor Dorau shows how municipal ownership has lost more ground during the past four years than it gained during the previous eight years. He explains the many factors which have brought, and will continue to bring, about these changes. He explains the origin of a majority of the municipal plants which have come and gone during the past fifty odd years by the simple fact that at the time no one else was willing to engage in the service. He shows that more than 54 per cent of these plants were started in communities of less than 1000 population and 85 per cent in communities of less than 2500 population. He brushes aside the attitude of certain groups of people toward government in business as relatively unimportant, presenting, with startling force, the political, legal, economic and technological factors involved in the operation of light and power plants and which leave local governments bogged down in the swamp of inefficiency.

It is a report which everyone who has the slightest interest in the light and power industry should read, word for word. If it is only preliminary, it is to be hoped that the author's final production will be ready for distribution in the near future and that the editor of the BULLETIN will receive an early copy.—*E. G.*

Edison: His Life and Inventions

By Frank Lewis Dyer and Thomas Commerford Martin with the collaboration of William Henry Meadowcroft. In two volumes, illustrated. Harper & Brothers, New York. Price, $10.00.

THIS is a simple, straightforward story of a simple, straightforward and very great American citizen which should be in every library, public or private, in the United States. Fortunately it contains little or no reference to the light and power industry and, therefore, it is safe for the official organ of the light and power industry to praise it. To mention it without praise would be to place the reviewer in the category of those who are actually illiterate and who make their living by writing comments on books based on the publisher's statements on the jacket.

The story of Edison is the greatest story which America has produced, not even excepting the stories of George Washington, Thomas Jefferson, Benjamin Franklin and Abraham Lincoln. It is so inspirational that educators might do well to include it in any plans for courses designed to mold the characters of the coming generation so that they may become useful citizens. Washington has been called the father of his country; Franklin, the first civilized American; Lincoln, the Emancipator; but to Edison has fallen the title of "The Greatest American Citizen."

To properly review this work, which happens to be the only authorized biography of Mr. Edison, would mean nothing more or less than to rewrite it. It is a very wonderful fairy story written by men who, following Mr. Edison for fifty or more years, have watched him make many fairy stories come true. In a sense it might almost be called an autobiography, because much of the account has been contributed or edited by Mr. Edison himself. In any event, the library which does not contain it can hardly claim the title "Library." It is just a place to store books.—*E. G.*

Public Service

A booklet. Contributors, William Butterworth, Roger W. Babson, M. S. Sloan, E. W. Herr, George B. Cortelyou, Thomas N. McCarter, Professor Irving Fisher. Edited by Irving Jay Rogers, 36 pages. Published by American Educational Press, New York. The publishers will supply these booklets at the following prices. In quantities to 2000, 16 cents per copy; 2500 or more, 14 cents per copy; 5000 or more, 12½ cents per copy; 10,000 or more, 9¾ cents per copy; 25,000 or more, 8¾ cents per copy.

THIS symposium by representative men of the country deals with the subject of government operation versus private operation of the public utilities, and is in effect an answer to the claims of public ownership proponents. While it may be claimed that Mr. Butterworth as president of the Chamber of Commerce of the United States, Mr. Babson as an economist, Mr. Herr as a manufacturer, and Messrs. Sloan, Cortelyou and McCarter as public utility operators are naturally biased in favor of private operation, the arguments they advance are incontrovertible. Although Professor Fisher asserts that private enterprises are subject to some of the temptations to mismanagement that are inherent in publicly operated enterprises, he writes that, ". . . few public businesses in America are now run, or can be run in the near future, by the public to better advantage than by private persons. The lower costs frequently cited to prove the benefits of, and necessity for, public operation are too often illusory—mere bookkeeping gains which disappear under any proper system of accounting."

This booklet deserves to be widely distributed.—*W. C.*

Women's Committee Meeting

(*Continued from page* 746)

and First Aid Teams which can appear before groups outside the industry demonstrating the Prone Pressure Method of Resuscitation and First Aid.

The women were urged by Miss Marguerite Butler to stimulate interest among all Women's Committee members in the National Public Speaking Contest arranged by the National Public Speaking Committee to be held during this association year.

Miss Sophia Malicki, member of the Industrial Relations Committee, called attention to the following reports of this committee and urged that they be read.

289-83 —Training for Better Public Contact—Building and Conducting the Training Program
289-44 —Training for Better Public Contact—Analysis of Public Contact Work
278-52 —Training for Better Public Contact—Its Necessity and Importance
289-56 —Health Promotion in the Public Utility Industry—Its Necessity and Importance

(*Continued top of next column*)

289-108—Training for Better Public Contact—Measurement of Results Obtained by a Public Contact Training Program

The subject of contact with outside groups was discussed by Miss Edna Decker, Miss Sue Carr and Mrs. Beulah Yewell. They told of the excellent work being done by Women's Committees within their territories with women's clubs, parent-teachers associations, schools, etc. Representatives of these groups are being invited into the educational meetings of Women's Committees, and members of Women's Commites are being asked by these organizations to appear before them with talks and demonstrations on subjects relating to the industry of interest to them.

The meeting was addressed by Mr. Paul S. Clapp, Managing Director, N. E. L. A., Mr. Harry Reid, Chairman, Public Relations National Section, and George F. Oxley, Director of Public Information, N. E. L. A.

MAGAZINE ARTICLES

What Happened at Menlo Park, N. J.

(*Continued from page* 699)

F. D. Barstow, Kitt, Blan, Shaw and Wardlaw; J. U. Mackenzie's daughter, Mrs. Chaffee, Mrs. Barstow, Mrs. Charles T. Hughes, and hosts from the surrounding towns and villages.

The pictures describe the tower with its huge lamp better than words. It was 135 feet high—from the ground to the top of the lamp. This was illuminated at 8 p. m. from Dearborn by Mr. Edison, amidst resounding applause from those at Menlo.

Within the space of the actual laboratory site inclosing the steel tower and huge lamp, in the exact center of the old laboratory site, was a concrete pedestal on top of which was a plate-glass case in which was a replica of the original lamp, this being illuminated from below by specially arranged lamps so as to appear luminous. This was the "perpetual light" started with the lighting of the tower lamp, its source of light coming from both the Public Service current and storage batteries concealed within the concrete pedestal. On the bronze door of this pedestal was the stamped lettering "1879-1929" and the words:

"The light once lit shall never dim
But through all time shall honor him."
—R. R. Bowker.

The tower and lamp were underwritten by Mr. Barstow and erected by the Public Service, the large and "perpetual lamp" being supplied by the Edison Lamp Works. The large lamp on the tower was composed of some 960 lamps.

President, Samuel Riddle, Louisville Railway Co., Louisville, Ky.; *Secretary*, E. F. Kelley, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia
President, A. C. Spurr, Wheeling Traction Co., Wheeling, W. Va.; *Secretary*, A. Bliss McCrum, Box 1483, Charleston, W. Va.

Great Lakes Division

(*Illinois, Indiana, Michigan, Wisconsin*)

President, G. C. Neff, Wisconsin Power & Light Co., Madison, Wis.; *Secretary*, Tom C. Polk, 140 South Dearborn St., Chicago, Ill.

Illinois State Electric Association
President, E. F. Kelly, Central Illinois Public Service Co., Springfield, Ill.; *Secretary-Treasurer*, George W. Schwaner, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association
President, C. V. Sorenson, Central Indiana Power Co., Indianapolis, Ind.; *Secretary-Treasurer*, William Stokes, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section
President, E. L. Edward, Michigan Electric Power Co., Lapeer, Mich.; *Secretary-Treasurer*, Herbert Silvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association
President, G. W. Van Derzee, Milwaukee Electric Railway & Light Co., Milwaukee, Wis.; *Executive Secretary*, John N. Cadby, 502 Brumder Bldg., 105 Wells St., Milwaukee,, Wis.

*Middle Atlantic Division

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association
President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary*, D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia
President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary*, A. B. Tunis, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, A. E. BETTIS, Kansas City Power & Light Co., Kansas City, Mo.; *Managing Director,* THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. MACY, Iowa Power & Light Co., Adel, Iowa; *Managing Director,* JOE CARMICHAEL, 310 Crocker Bldg., Des Moines, Iowa.

Kansas Section

President, FRANK M. STONE, Kansas Utilities Co., Fort Scott, Kan.; *Secretary,* H. LEE JONES, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, T. J. STRICKLER, Kansas City Gas Co., Kansas City, Mo.; *Secretary-Treasurer,* F. D. BEARDSLEE, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. AMIDON, Central Power Co., Grand Island, Neb.; *Managing Director,* THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, C. H. HODSKINSON, The Edison Electric Illuminating Co., Boston, Mass.; *Secretary,* MISS O. A. BURSIEL, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, THOMAS T. PARKER, Northwestern Public Service Co., Huron, S. D.; *Secretary,* JOHN W. LAPHAM, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, M. L. HIBBARD, Idaho Power Co., Boise, Idaho; *Secretary,* BERKELEY SNOW, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, E. B. CRIDDLE, Southern Sierras Power Co., Riverside, Cal.; *Secretary,* SAMUEL H. TAYLOR, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. POOLER, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary,* L. C. MCCULLOUGH, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, W. D. JOHNSTON, Mountain States Power Co., Casper, Wyo.; *Secretary,* O. A. WELLER, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, H. S. ROBERTSON, Denver Tramway Corp., Denver, Colo.; *Secretary,* O. A. WELLER, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. NIELSEN, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer,* BERNARD L. WILES, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. JOHNSTONE, Mountain States Power Co., Casper, Wyo.; *Secretary,* F. A. PROBST, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, T. H. TUTWILER, Memphis Power & Light Co., Memphis, Tenn.; *Secretary,* C. M. KILIAN, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, FRED W. INSULL, Public Service Co. of Oklahoma, Tulsa, Okla.; *Secretary,* S. J. BALLINGER, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. BANN, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary,* R. I. BROWN, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. JONES, Jones-Johnson Co., McComb, Miss.; *Secretary,* A. R. RIDDICK, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, THOMAS R. WEYMOUTH, Oklahoma Natural Gas Corp., Tulsa, Okla.; *Secretary,* EDWARD F. MCKAY, 1020 Petroleum Bldg., Oklahoma City, Oyla.

Southwestern Public Service Association

President, KNOX LEE, Southwestern Gas & Electric Co., Marshall, Tex.; *Secretary,* E. N. WILLIS, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—(To be determined.)

Charles A. Coffin Prize Committee—M. S. SLOAN, The New York Edison Co., New York, N. Y.

Codes and Standards Committee—IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. PACK, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—BRITTON I. BUDD, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. GOLDSCHMIDT, Wagner Electric Corp., New York, N. Y.

Finance Committee—SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. ONKEN, JR., *Electrical World,* New York, N. Y.

Public Policy Committee—P. S. ARKWRIGHT, Georgia Power Co., Atlanta, Ga.

Rate Research Committee—L. R. NASH, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Buffalo, N. Y.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—JOHN B. REYNOLDS, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—FRED R. JENKINS, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. SAWYER, Stevens & Wood, Inc., New York, N. Y.

***Membership Committee**—A. JACKSON MARSHALL, National Electric Light Association, New York, N. Y.

***Rural Electric Service Committee**—EUGENE HOLCOMB, Consumers Power Co., Jackson, Mich.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—W. R. EMERSON, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Budget Committee—B. F. RODEY, The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. HASBROUCK, H. C. Hopson & Co., New York, N. Y.

***Customers' Records Committee**—E. W. KORSMEYER, Henry L. Doherty & Co., New York, N. Y.

Exhibit Committee—T. A. WALLACE, Henry L. Doherty & Co., New York, N. Y.

***Fixed Capital Committee**—THOMAS M. FORD, The Philadelphia Electric Co, Philadelphia, Pa.

***General Records Committee**—C. E. MCBRIDE, Electric Bond & Share Co, New York, N. Y.

***Purchasing and Storeroom Committee**—K. C. CAMPBELL, The Detroit Edison Co., Detroit, Mich.

***Statistics Committee**—HARRY A. SNOW, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

***Section's Executive Committee**—MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. TALLMAN, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. WILHELMY, The Union Gas & Electric Co., Cincinnati, Ohio

General Power Committee—H. C. THUERK, Associated Gas & Electric System, New York, N. Y.

Industrial Heating Committee—J. L. FADEN, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—M. E. SKINNER, New York Power & Light Corp., Albany, N. Y.

Commercial and Industrial Lighting Committee W. H. HORTON, JR., West Penn Power Co., Pittsburgh, Pa.

Electrical Advertising Committee—C. J. EATON, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. BLACKWELL, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. MALCOMSON, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—FRANK D. PEMBLETON, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—FRANK A. COUPAL, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. HAROLD, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. DUNN, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—NORMAN T. WILCOX, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. EAST, Public Service Co. of Northern Illinois, Chicago, Ill.

***Wiring Sales Committee**—A. P. GOOD, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—A. D. BAILEY, Commonwealth Edison Co., Chicago, Ill.

***Accident Prevention Committee**—C. R. BEARDSLEY, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—R. A. HENTZ, The Philadelphia Electric Co., Philadelphia, Pa.

Engineering Administration Committee—W. E. MITCHELL, Georgia Power Co., Atlanta, Ga.

Engineering Research Committee—C. F. HIRSHFELD, The Detroit Edison Co., Detroit, Mich.

***Hydraulic Power Committee**—BYRON E. WHITE, Utica Gas & Electric Co, Utica, N. Y.

***Inductive Coordination Committee**—H. L. WILLS, Georgia Power Co, Atlanta, Ga.

***Meter Committee**—A. S. ALBRIGHT, The Detroit Edison Co, Detroit, Mich.

***Overhead Systems Committee**—SYDNEY ALLING, The Rochester Gas & Electric Corp., Rochester, N. Y.

***Power System Engineering Committee**—L. W. W. MORROW, *Electrical World,* New York, N. Y.

***Prime Movers Committee**—R. D. DEWOLF, The Rochester Gas & Electric Corp., Rochester, N. Y.

***Underground Systems Committee**—G. C. MCCABE, The Detroit Edison Co., Detroit, Mich.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—HARRY REID, National Electric Power Co., New York, N. Y.

***Cooperation with Educational Institutions**—JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Committee**—T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—(To be determined.)

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—CHARLES B. STUART, Halsey Stuart & Co., New York, N. Y.

***Women's Committee**—MISS SARA HARRIS, Utica Gas & Electric Co., Utica, N. Y.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

November

11–12 Public Information Bureau Directors, Edgewater Beach Hotel, Chicago, Ill.

18 Educational Committee, Mount Royal Hotel, Montreal, Can.

21–22 Public Utilities Association of Virginia, Chamberlain-Vanderbilt Hotel, Old Point Comfort, Va.

26 Insurance Committee, N. E. L. A. Headquarters, 420 Lexington Ave., New York, N. Y.

December

2–4 Conference of Utility Association Secretaries, Drake Hotel, Chicago, Ill.

2–4 *American Institute of Electrical Engineers, Regional meeting, Chicago, Ill.*

2–6 *American Institute of Mechanical Engineers, Annual meeting, New York, N. Y.*

4–7 *American Society of Refrigerating Engineers, New York, N. Y.*

January

13–14 Accident Prevention Committee, N. E. L. A. Headquarters, 420 Lexington Ave., New York, N. Y.

16–17 Lighting Bureau Committees, Hotel Schenley, Pittsburgh, Pa.

20–21 North Central Electric Association, Commercial Section, St. Paul Hotel, St. Paul, Minn.

23–24 Overhead Systems Committee, Baltimore, Md.

27–31 *American Institute of Electrical Engineers, Santa Monica, Cal.*

February

24–25 Accounting National Section Group Committee Meetings, Book Cadillac Hotel, Detroit, Mich.

24–25 North Central Electric Association, Engineering Section, Nicollet Hotel, Minneapolis, Minn.

March

10–13 Engineering National Section, Group Committee Meetings, Edgewater Beach Hotel, Chicago, Ill.

April

23–25 Middle West Division, Des Moines Hotel, Des Moines, Iowa.

28–30 *Chamber of Commerce of U. S. A., Washington, D. C.*

May

1–2 *Chamber of Commerce of U. S. A., Washington, D. C.*

12–16 *National Fire Protection Association, Atlantic City, N. J.*

June

11–12 North Central Electric Association, Managerial, Alex Johnson Hotel, Rapid City, S. D.

16–20 NATIONAL ELECTRIC LIGHT ASSOCIATION, EXPOSITION AUDITORIUM, SAN FRANCISCO, CAL.

16–25 *World Power Conference, Berlin, Germany.*

23–27 *American Institute of Electrical Engineers, Toronto, Can.*

NEW MEMBERS

Light and Power Companies, Employees of Light and Power Companies, Invited Persons, Manufacturing Companies, Employees of Manufacturing Companies, Associated Companies, Employees of Associated Companies and Foreign Organizations who have recently become Members of the National Electric Light Association.

NOTE: Names of new individual members are shown in the following order: First, in italics, post office address of company employing new members, and on the same line, in Roman letters, the name of the company employing new members; on succeeding indented lines, names of new members followed by post office address.

Electric Light and Power Companies (Class A)

Nebraska, Scottsbluff, The Western Public Service Company

Employees of Electric Light and Power Companies (Class B)

Alabama, Birmingham, Alabama Power Company
    R. H. Freese
    Jno. F. Young (Montgomery, Ala.)

California, Fresno, San Joaquin Light & Power Corp.
    James A. Mulkey
    G. L. Perrin

California, Los Angeles, Los Angeles Gas and Electric Corp.
    J. B. Prewett

California, Riverside, The Southern Sierras Power Company
    John S. Allan

California, San Francisco, Great Western Power Company of California
    Ernst E. Behr
    Arnold B. Gerhan

California, San Francisco, Pacific Gas & Electric Company
    R. G. McDonald (Eureka, Cal.)

California, Santa Cruz, Coast Counties Gas & Electric Company
    Don A. McCullough

Connecticut, Hartford, The Hartford Electric Light Company
    B. R. Foote
    J. William Lancto (Wethersfield, Conn.)
    Theodore Newcomb

Connecticut, Stamford, The Stamford Gas & Electric Company
    John W. Clark
    Prentice M. Hatch

Connecticut, Waterbury, The Connecticut Light & Power Company
    G. E. Cockings (Bristol, Conn.)
    Roy E. Darroch (New Britain, Conn.)
    Charles A. Duggan (Bristol, Conn.)
    Raymond O. Mills
    Richard P. Peale (Hartford, Conn.)
    C. George Rathke (Greenwich, Conn.)
    Robert P. Welton (Bristol, Conn.)

Georgia, Atlanta, Georgia Power Company
    G. F. Smith (Tallulah Falls, Ga.)

Illinois, Chicago, Commonwealth Edison Company
    John W. Baring
    M. P. Below
    Richard Buracker
    John A. Craig
    Robert L. Farrow
    Stanley E. Goodell
    Walter Meyer
    John P. Tegel

Illinois, Chicago, Illinois Power and Light Corporation
    S. L. Hilyard (East St. Louis, Ill.)
    J. E. Strong (East St. Louis, Ill.)

Illinois, Chicago, Public Service Company of Northern Illinois
    Leslie C. Bieger (Forest Park, Ill.)
    Clive R. Bishop

Illinois, Waukegan, Public Service Company of Northern Illinois
    Murray R. Boess
    John M. Clifton (Evanston, Ill.)
    O. B. Dorsey (Chicago, Ill.)
    Harold T. Eddy (Chicago, Ill.)
    D. V. Forester (Harvey, Ill.)
    Frank J. Kerous (Oak Park, Ill.)
    E. Bernhard Klemola (Evanston, Ill.)
    Elmer Malmquist (Blue Island, Ill.)
    J. R. Martin (Chicago, Ill.)
    A. J. Mitchell (Joliet, Ill.)
    Robert M. Ploetz (Chicago, Ill.)
    C. W. Port (Joliet, Ill.)
    Joseph G. Rogers (Oak Park, Ill.)
    C. G. Schlegel
    E. D. Sheehan (Evanston, Ill.)

Maine, Augusta, Central Maine Power Company
    M. A. Perkins, Jr. (Lewiston, Me.)

Maine, Portland, Cumberland County Power & Light Company
Fred W. Marshall (York Harbor, Me.)
A. D. Welch (Kennebunkport, Me.)

Massachusetts, Boston, Edison Electric Illuminating Co. of Boston
Clara T. Durgin
Robert W. Mitchell

Massachusetts, Boston, New England Power Company
Harry Hanson

Massachusetts, Boston, Stone & Webster, Inc.
Alan D. Duff

Massachusetts, Boston, Twin State Gas & Electric Company
G. A. Walter (St. Johnsbury, Vt.)

Massachusetts, Brockton, Edison Electric Illuminating Co. of Brockton
Carl G. Polson
LeRoy B. Witcher

Massachusetts, Cambridge, Cambridge Electric Light Company
Leslie J. Kewer (Dorchester, Mass.)

Massachusetts, Fitchburg, Fitchburg Gas & Electric Light Company
Wm. J. Marlowe

Massachusetts, Franklin, Union Light & Power Company
John F. Conroy

Massachusetts, Gardner, Gardner Electric Light Company
Edna M. Joslin

Massachusetts, Lawrence, Lawrence Gas & Electric Company
Reginald J. Griffin
Harry J. Trees
Joseph T. Wade

Massachusetts, Lowell, The Lowell Electric Light Corporation
L. Alford Frost
John Arthur Hunnewell
Clayton M. Williamson

Massachusetts, Manchester, The Manchester Electric Company
Leon O. Holmes (So. Manchester, Conn.)

Massachusetts, Plymouth, Plymouth Electric Light Company
Fred L. Raymond

Missouri, Kansas City, Kansas City Power & Light Company
Harry A. Brunner (North Kansas City, Mo.)
Grace B. Sexton (North Kansas City, Mo.)

New Hampshire, Portsmouth, New Hampshire Gas & Electric Company
Nelson T. Wright

New Jersey, Newark, Public Service Electric & Gas Company
A. Ward Ackerman (Passaic, N. J.)
Richard H. Barker
A. R. Dunning (Orange, N. J.)
Cecil W. Guyatt
George Marshall

New York, Brooklyn, Brooklyn Edison Company, Inc.
Henry F. Ahrens
L. Lucile Hanan
Louis C. Pils
Reginald J. Snyder
Frank W. Stahl

New York, Mt. Vernon, Westchester Lighting Company
Newton D. LeFevre (Yonkers, N. Y.)
Herbert F. Miller (Yonkers, N. Y.)
Thomas J. Murtha (Bronx, N. Y.)
M. Elizabeth Robbins
William H. von Lampe (Yonkers, N. Y.)

New York, New York, Bronx Gas & Electric Company
Harry J. Blanck
John L. Hart (Fair Haven, N. J.)
Ruth D. Kruger (Bronx, N. Y.)

New York, New York, The New York Edison Company
Gustav H. Raap (Bronx, N. Y.)
Arthur C. Trayer (Valley Stream, L. I., N. Y.)

New York, New York, The United Electric Light & Power Company
James V. Brady (Maspeth, L. I., N. Y.)

New York, Yonkers, Yonkers Electric Light & Power Company
T. G. Brooks
Clifton A. Burriss
Lois M. Payne
Philip Polito

New York, Poughkeepsie, Central Hudson Gas & Electric Corporation
R. E. Decker (New Paltz, N. Y.)
E. D. Ketcham
H. A. McLaughlin
Thomas P. Waye (Saugerties, N. Y.)

North Carolina, Raleigh, Carolina Power & Light Company
W. Henry Horne, Jr.
Randolph M. Hull

Ohio, Columbus, The Columbus Railway, Power & Light Company
E. E. Grover

Ohio, Columbus, The Columbus Railway Power & Light Company
T. A. Bangs
A. C. Beck

Ohio, Columbus, The Ohio Utilities Company
C. G. Neff

Oregon, Portland, Pacific Power & Light Company
L. A. Dick (Dayton, Wash.)
Leo Forsythe (Enterprise, Ore.)
Richard M. Hopper (Goldendale, Wash.)
L. R. Sheeley (Bend, Ore.)
M. C. Thorne (Pomeroy, Wash.)

Pennsylvania, Pittsburgh, West Penn Power Company
Otto John Schaeffer

Pennsylvania, Reading, Metropolitan Edison Company
Howard B. Allen (York, Pa.)

Pennsylvania, Allentown, Pennsylvania Power & Light Company
R. K. McMaster

Tennessee, Bristol, Bristol Gas & Electric Company
Joe H. Grubbs

Tennessee, Bristol, Bristol Gas & Electric Company
Ben A. Fleshman

Tennessee, Chattanooga, Southern Cities Power Company
W. W. Carlton (Shelbyville, Tenn.)

Tennessee, Johnson City, Tennessee Eastern Electric Company
R. F. Lander

Tennessee, Kingsport, Kingsport Utilities, Incorporated
E. W. Hogg

Tennessee, Knoxville, Knoxville Power & Light Company
N. A. Taggart

Tennessee, Memphis, Memphis Power & Light Company
Ward Barnum
Robert Bruce
W. N. Ford

Vermont, Rutland, Vermont Hydro-Electric Corporation
Fred J. Gokey (Claremont, N. H.)

Washington, Aberdeen, Grays Harbor Railway & Light Company
L. G. McClellan

Wisconsin, Milwaukee, The Milwaukee Electric Railway & Light Company
Lawrence J. Beckwith

Canada, Ontario, Ottawa, Gatineau Power Company
R. H. Barber (New York, N. Y.)
H. C. Scott (New York, N. Y.)

Manufacturing Companies (Class D)

Illinois, Chicago, The Frederick Company

Employees of Manufacturing Companies (Class E)

Connecticut, Meriden, The Miller Company
James D. Daly
A. E. Lowe

Connecticut, Waterbury, Beardsley & Wolcott Mfg. Co.
L. M. Pond

Illinois, Chicago, The Frederick Company
H. D. Valentine

Illinois, Peoria, Altorfer Brothers Company
Edward Fairchild (Belmont, Mass.)

Illinois, Chicago, Chicago Flexible Shaft Company
Samuel Wells (Seattle, Wash.)

Illinois, Chicago, Edison Electric Appliance Company
H. F. Huggins (San Francisco, Calif.)
Miss Marion Elizabeth Marble (Boston, Mass.)

Iowa, Newton, Automatic Washer Company
Thomas B. Mulgrew (Atlantic, Mass.)

Massachusetts, Worcester, American Steel & Wire Company
F. K. Sawyer

New Jersey, Trenton, John A. Roebling's Sons Company
H. O. Cauldwell (Chicago, Ill.)
James N. Colkitt (Los Angeles, Cal.)
George I. Gheen (Cleveland, Ohio)
George E. Huff (Atlanta, Ga.)
E. C. Low (San Francisco, Cal.)
Harold P. Peabody (Boston, Mass.)
G. E. Walker (Portland, Ore.)

New Jersey, Orange, Thos. A. Edison, Incorporated
Curtis Prout

New York, New York, The Okonite Company
Richard S. Hayes (Chicago, Ill.)

New York, New York, Westinghouse Lamp Company
J. F. O'Brien

New York, New York, Worthington Pump & Machinery Corporation
George E. Freethy (Boston, Mass.)

THE BADGE OF SERVICE
Join!
THE AMERICAN RED CROSS
CORNELIUS HICKS

New York, Rome, Rome Wire Company
David E. Allen (Birmingham, Ala.)

New York, Schenectady, General Electric Company
W. E. Madden (Los Angeles, Cal.)

New York, New York, Otis Elevator Company
William C. Blackwood (Jackson Heights, N. Y.)

New York, New York, Safety Cable Company (Division of General Cable Corporation)
J. E. Harrall (Philadelphia, Pa.)

Ohio, Cleveland, National Lamp Works of G. E. Co.
M. E. Learnard (Providence, R. I.)

Ohio, Mansfield, Westinghouse Electric & Mfg. Co.
John H. Spraggon (New Haven, Conn.)

Ohio, Mansfield, Westinghouse Electric & Mfg. Company
A. E. Enger (San Francisco, Cal.)
D. C. Harker (San Francisco, Cal.)
C. G. Ong (Lester, Pa.)

Pennsylvania, Pottstown, Automatic Electric Heater Company
Paul V. Quick (Berkeley, Cal.)

Associated Companies (Class F)

Massachusetts, Wellesley Hills
Alton D. Adams (Consulting Engineer)

New York, New York, Westinghouse Electric Supply Company

Employees of Associated Companies (Class G)

Connecticut, Stamford, F. A. Bartlett Tree Expert Company
W. Wilson Heinitsh (Cynwyd, Pa.)
George B. Muth (Cynwyd, Pa.)
George Peabody, Jr. (Cynwyd, Pa.)
A. F. W. Vick (Cynwyd, Pa.)

Missouri, Kansas City, The Chas. L. Ward Company
James Colwell (Omaha, Neb.)

New York, New York, International Standard Electric Corp.
Edmond E. Lincoln

New York, New York, General Contract Purchase Corporation
H. J. Francis

New York, New York, Westinghouse Electric Supply Company
Jack Fly (Little Falls, Minn.)
John J. Gibson
W. J. Smith (Duluth, Minn.)

Wisconsin, Milwaukee, Julius Andrea & Sons Co.
Everell S. Kyle

Foreign Members (Class H)

Scotland, Glasgow, Yarrow & Co. Ltd.

Guide to This Issue

General

PUBLIC UTILITY CONSTRUCTION PROGRAM FOR 1930 LAID BEFORE PRESIDENT HOOVER, 765

Paul S. Clapp

An account of the Conference at Washington between the President and leaders of the public utilities.

AMPLIFIER TALKS TO A DISTINGUISHED GUEST, 768

Amplifier

M. Meyer, Directeur General, Electricite de Strasbourg, visits the United States after an absence of eighteen years and gives his impression of the electrical industry's progress in that period.

PRIVATE OR GOVERNMENT OWNERSHIP OF PUBLIC UTILITIES—PART ONE, 769

A. H. Markwart

A remarkably fine weighing of the advantages and disadvantages of two forms of operation of public utilities. The author approaches the discussion from a national viewpoint, and as an observer whose experience has caused him to view problems concretely.

ROUTINE DISTRIBUTION OF N.E.L.A. COMMITTEE REPORTS, 774

A. Jackson Marshall

The mechanics of distributing Committee Reports to those who have a particular interest in them.

WOMAN'S OPPORTUNITY IN THE ELECTRICAL INDUSTRY, 776

Alice M. Baker

"Women of the utility business, we need not a new chance, but a clear vision to discern the chance which at this very hour is ours for the taking."

OPERATING A HYDRO-ELECTRIC SYSTEM FOR BEST ECONOMY, 777

E. B. Strowger

The James H. McGraw First Prize Paper for 1928-29. An analysis of the operation of a plant and a description of the means employed for making reasonably certain of a maximum production for given resources.

THE DOMESTIC LOAD AND SOME OF ITS PROBLEMS FROM THE UTILITY STANDPOINT, 781

H. C. Rice

A discussion of the customer relations aspects in wiring installations, wiring standards, the Safety Code and related matters.

BEHIND THE VEIL: ELECTRICITY AND COMMUNICATIONS, 783

Ernest Greenwood

Concerning Samuel F. B. Morse and the antecedents and genesis of the electric telegraph. The ninth of a series of articles portraying against a social-historic background the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

A NOVEL CAMPAIGN FOR THE PRESIDENCY OF A N.E.L.A. COMPANY SECTION, 788

BILL DELIVERY POLICIES, 792

Customer Relations Committee, Great Lakes Division, N.E.L.A.

A study of the merits and disadvantages of certain methods of bill presentation to customers.

Departments

THE PRESIDENT'S PAGE

Christmas Greetings

THIS is to wish all members of the great electric family a Merry Christmas and a Happy and Prosperous New Year.

Ours is a job of service. Our industry is the nation's power plant. It supplies energy essential to the growth and development of business of every nature and of communities of every size. It lifts the burden of toil from human shoulders and raises standards of living by bringing convenience, comfort, economy, beauty into millions of homes.

Many times it has been said that the truest human happiness is found in useful work. Our jobs, therefore, should yield real happiness throughout the year and prove an inspiration to greater effort in behalf of the public we work for.

President.

Resources

IN evaluation of the resources of the nation, not enough emphasis has been placed on our greatest asset—the capacities and abilities of men.

Among the impressions gained from the recent meeting in Washington of some three hundred business men under the chairmanship of Mr. Julius Barnes, one in particular stood out. That was: The energy, initiative, intelligence and progressiveness of the business men in the conference is the most positive of all the assurances of future progress. Under their direction, the great construction and development programs will, from typewritten budget estimates, translate into production of steel, equipment materials, automobiles, power houses, goods, and services. Mirrored in those attending the conference were the pulsating energies of the millions of Americans who daily apply in most vigorous fashion President Hoover's sound suggestion—WORK.

None present at the conference could help but be impressed with the interdependence and interlinkage of the various elements which go to make up the business fabric. "No man liveth unto himself." Certainly, it is clear that no business, no industry or commercial relation lives unto itself. The possibilities of future development and expansion and the immediate performance of every business is intertwined with those of others. So it was, as the leaders of different industries spoke — railroads, steamships, textiles, mining, insurance, public utilties, agriculture, banking, automobiles, chemicals, and many others—there developed the spirit of a new mutual understanding of this interrelation, and a realization that the progress of each depends upon the prosperity of the other.

The electric light and power companies, with their services now extending to homes, factories, mills, shops and transportation, in a peculiar way intertwine and interlace themselves through this whole business fabric. The assurances made by Mr. Sloan of new construction and future progress of the electric light and power companies correctly portray the part they will have in this stupendous undertaking of business team play.—P. S. C.

Keeping Promises

DECREASES in rates for domestic service during 1929 will average more than 5 per cent for the country as a whole, if, as is more than likely, the figures for the last four months of the year show the same rate of decrease as was apparent up to September 30.

The trend of rates for electricity has been consistently downward since the organization of the electrical industry as such, but more particularly has this been true during the last few years—or since large scale consolidations have become the rule.

In the effecting of such consolidations and interconnections, the public was promised, actually or tacitly, improved service and a lowering of rates wherever, and whenever consistent with the maintenance of good service, and with due regards for future expansion demands.

These promises are being magnificently honored. Hardly a month passes without the recording of some major example of a benefit of interconnection. The more spectacular of these being, of course, the relief afforded areas stricken by the elements. Cost of electric service to the consumer has gone down, very largely as the result of voluntary reductions as conditions permitted—and will continue to go down as rapidly as economic conditions warrant.

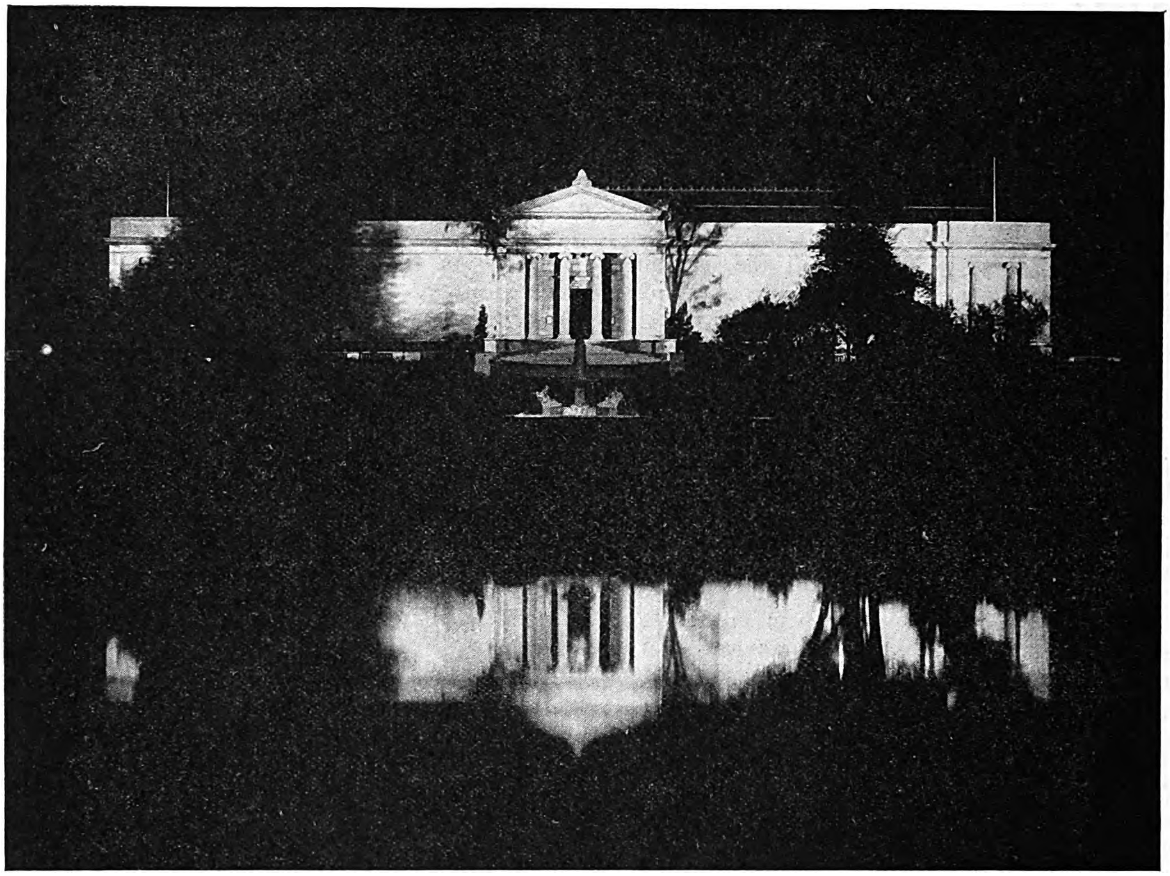
An interesting sidelight on rate reductions is that the percentage of reduction—or the dividend to consumers—will compare not unfavorably with dividends earned for stockholders.

Local Character of Power Supply

TO a steadily increasing degree, electric light and power has become associated with the fortunes of American industry. Three quarters of all manufacturing establishments are now electrified and, out of every three horsepower of motor-driven machinery, two now operate on power purchased from the lines of public utility enterprises.

Not only civic duty, but also enlightened self-interest thus dictate an increasing solicitude toward the fostering of manufacture and the encouragement of industrial development on the part of public utility organizations. It is most encouraging to note, all over the country, the growing activities of the industrial department of electric light and power companies. "Increased industrial activity will mean more business in every direction" states the most recent industrial development bureau "including, of course, an increased load on our power lines. The corporation is undertaking this work not as a matter of philanthropy, but to further its own growth, which is obviously dependent upon the intelligence and foresight with which it serves not merely the communities in which it operates, but the State as a whole."

What more is necessary to point out the inherent interdependence of the utility company and the territory which it serves and to emphasize again the essentially *local* character of electric power supply?



"Moonlighting" the Cleveland Museum of Art

A night-time scene of extraordinary beauty is created by the "moonlighting" of the Cleveland Museum of Art. The lighting system is the gift of The Cleveland Electric Illuminating Company, in commemoration of the fiftieth anniversary of the invention of the first practical incandescent lamp by Thomas Alva Edison.

Public Utility Construction Program for 1930 Laid Before President Hoover

How It Will Affect Labor and Industry

By PAUL S. CLAPP
Managing Director, National Electric Light Association

AT ten o'clock Wednesday morning, November 27, one of the most representative groups of utility leaders yet assembled gathered in the Cabinet Room at the White House. They were executives from the gas, street railway, and electric light and power fields from all sections of the United States.

Seated about the long table in the historic room they awaited the arrival of President Hoover. They had come at his invitation to assure him and the entire country of the part these utilities will take in the great construction programs for 1930, which, translated into purchase of materials and employment of men, means continuation in the forward march of business.

In the room were two whose lives and work span the whole history of electric power development—Mr. Samuel Insull and Mr. Charles L. Edgar—both rugged pioneers, and early associates of Mr. Edison. Another present was Mr. George B. Cortelyou, who had often sat in this same room as a cabinet officer with Presidents McKinley and Roosevelt. Mr. Owen D. Young who, with all his distinguished service in other fields, still holds electrical progress nearest his heart, was there.

After a short wait the President came into the room from his own office and greeted the assembly.

Mr. M. S. Sloan, President of the National Electric Light Association, in behalf of the electric light and power companies, then read the statement which follows. The information it contained had been gathered by telephone in the forty-eight hours preceding the conference.

Electric Light and Power Statement

> "The electric light and power utility companies of the country contemplate an expenditure during 1930 of $865,000,000 for expansion of their facilities, an increase of $65,000,000 over corresponding expenditures for 1929. This does not include expenditures for maintenance.
>
> "The programs provide for expansion and development in all sections of the United States.
>
> "The electric utilities must maintain themselves in a position to meet increasing demands for service as they develop, and they, therefore, plan their construction well in advance.
>
> "The plans for 1930 are completed, large commitments have already been entered into, and many contracts for equipment and material have been placed. Careful consideration of existing conditions has justified this expansion in anticipation of the growing requirements of industry for power, and consumers generally for increased electric service."

Mr. J. N. Shannahan, of Omaha, in the absence of Mr. Paul Shoup, President of the American Electric Railway Association, presented the electric railway statement, as follows:

Electric Railway Statement

> "A canvass of the electric railway companies of the United States, comprising street car, rapid transit, interurban and bus lines handling approximately 16 billion passengers annually, indicates that 97% of the executives responding to our inquiry do not anticipate that the present stock market situation will affect their capital and maintenance expenditures during the coming year:
>
> "This survey, made at the suggestion of Paul Shoup, President of the American Electric Railway Association, who is unfortunately unable to attend this conference due to his presence on the Pacific Coast, indicates that this industry which during 1929 is spending approximately $1,000,000 a day for maintenance, betterments and extensions, expects to maintain or

exceed this rate of expenditure during 1930.

"At a meeting held at the Association's headquarters in New York on November 26, 1929, representative executives of companies operating in various parts of the country expressed their confidence in the business outlook and their desire to cooperate with President Hoover in every possible way in his effort to stabilize and insure the continued progress and development of business. Analysis of the transportation situation in a number of large cities indicates that as progress is made in bringing about better public understanding of the economic problems involving, improvement in credit will permit considerable increases in capital expenditures to be made for expansion of facilities."

Mr. B. J. Mullaney, President of the American Gas Association, speaking for the gas utilities, both manufactured and natural, made the following statement:

Gas Industry's Statement

"The American Gas Association Statistical Department estimates that expenditures for construction by the manufactured and natural gas industry of the United States in 1930 will aggregate approximately $425,000,000, an increase of about 6% over the corresponding expenditures in 1929. An additional $50,000,000 will be expended to maintain existing service facilities.

"The construction estimate is based primarily upon budget provisions already formulated for 1930 by companies representing the major part of gas production and distribution in the United States. The conclusions thus indicated have been checked against the factual experience of the industry for many years, as well as against current observation and information, and have been correspondingly strengthened.

"Gas industry growth, while unspectacular, has been marked and steady for upwards of twenty years. The latter part of the period has been its time of most rapid gain. Complete statistical reports for nine months, and covering upwards of 85% of the output, indicate that the total output for 1929 should be about 9% ahead of the 1928 total.

"Construction programs have to anticipate this growth, as well as provide for the consequences of new trends and changing conditions, such as more and more large-volume industrial use of gas; accelerated use for additional domestic purposes, including house heating; increased density of population and use where large apartment houses supplant single-family dwellings. Expansion is further stimulated by the growing popular recognition of gaseous fuel advantages and by the research that develops better utilization.

"In the natural gas branch of the industry, the existence of vast known reserves, coupled with large increases in production, is making long distance transmission economically practicable to a degree not anticipated a few years ago. Development along this line will undoubtedly continue for many years.

"These and collateral facts, trends and factors have been coordinated with obvious necessities in estimating the construction requirements of the industry for 1930. The net results, as summed up in the first sentence of this statement, have been reviewed by officers of the larger gas producing and distributing companies, assembled for that purpose at A. G. A. Headquarters in New York yesterday, and have been approved as a reasonable forecast.

"The customer contacts and day-to-day experiences of the companies represented in the conference reflect no disturbing change in business conditions or trends. They suggest no reason at this time for curtailing the contemplated expenditures for the construction and extension of gas service facilities. On the contrary, it is conceivable that cheaper money, as predicted by many forecasters in economics, might accelerate construction especially on the natural gas side of the industry."

Statement for Combined Utilities

With the individual statements for each of the three utilities concluded, a dramatic moment arrived when Mr. Sloan arose to make the combined statement for the gas, street railway and electric light and power utilities. He said:

> "The electric light and power, manufactured and natural gas, and electric railway utilities contemplate the expenditure of $1,400,000,000 during 1930 for new construction and expansion of facilities, an increase over the corresponding expenditures for 1929 of $110,000,000.
>
> "In addition to this amount, they will spend to maintain existing properties $410,000,000."

In this short statement of fifty words, one of the largest construction programs of the country was announced, the full purport of which is almost beyond visual-

© Wide World

UTILITY LEADERS PHOTOGRAPHED ON LAWN OF THE WHITE HOUSE

Those in the group are listed on next page in body of article ization. It means employment of thousands of men in building power houses, transmission lines, dams, laying pipe lines, constructing gas facilities, and extending street railway service. Orders for equipment and material will keep thousands of others employed in factories, mills, and mines producing and fabricating the tons of copper, steel, aluminum, cement, and other materials involved. So complete is the interlinkage of business and industry and so stupendous is this construction program alone, that it may be safely said every citizen benefits.

President Hoover called on those present for statements, one after another. The executives told in their own way of the plans for their own companies. There was no note of uncertainty, no hesitation in the announcement of definite programs of construction already planned and actually under way. The confidence of these executives in the future of these three basic electric utilities which they so completely understand, and in the present stability of business, expresses itself in positive action.

Present at the Conference

Several of those invited were unable to get to Washington in time for the Conference. Those present were:

Barnes, J. P., Pres., Louisville Railway Co., Louisville, Ky.
Bruce, Howard, Chmn., The Bartlett Hayward Co., Baltimore, Md.
Carlisle, F. L., Chmn., Northeastern Power Corp., New York, N. Y.
Clapp, Paul S., Managing Director, Natl. Elec. Lt. Assn., New York,N.Y.
Clifford, G. H., Pres., Stone & Webster Service Co., Boston, Mass.
Cobb, B. C., Chmn., Allied Power & Light Corp., New York, N. Y.
Cortelyou, Geo. B., Pres., Consolidated Gas Company, New York, N. Y.
Couch, Harvey, Pres., Arkansas Pwr. & Lt. Co., Pine Bluff, Ark.
Dame, F. L., Pres., North American Co., New York, N. Y.
Davis, Judge Stephen B., Director, Joint Committee of National Utility Associations, New York, N. Y.
Draper, W. A., Pres., Cincinnati Street Railway Co., Cincinnati, Ohio.
Edgar, Chas. L., Pres., Edison Electric Ill'g Co., Boston, Mass.
Erickson, Halford, V. P., Byllesby Engineering & Management Corp., Chicago, Ill.
Forward, Major Alexander, Managing Director, American Gas Assn., New York, N. Y.
Freeman, W. W., V. P., Columbia Gas & Electric Co., New York, N. Y.
Gadsden, P. H., V. P., United Gas Improvement Co., Philadelphia, Pa.
Gordon, Charles, Managing Director, American Electric Railway Assn., New York, N. Y.
Gossler, P. G., Pres., Columbia Gas & Electric Co., New York, N. Y.
Groesbeck, C. E., Pres., Electric Bond & Share Co., New York, N. Y.
Hannah, J. H., Pres., The Capitol Traction Co., Washington, D. C.
Hulswit, F. T., Pres., American Commonwealth Corp., New York, N. Y.
Insull, Samuel, Pres., Commonwealth Edison Co., Chicago, Ill.
Jones, W. A., V. P., Cities Service Co., New York, N. Y.
McCarter, Thos. N., Pres., Public Service Electric & Gas Co., Newark, N. J.
Miller, John B., Chmn., Southern California Edison Company, Los Angeles, Cal.
Mitchell, S. Z., Chmn., Electric Bond & Share Co., New York, N. Y.
Mullaney, B. J., Pres., American Gas Association (V. P., Peoples Gas Light & Coke Co., Chicago, Ill.).
Paige, C. E., V. P., Brooklyn Union Gas Co., Brooklyn, N. Y.
Richardson, Guy A., V. P. and Gen. Mgr., Chicago Surface Lines, Chicago, Ill.
Robertson, A. W., Chmn., Westinghouse Electric & Mfg. Co., New York, N. Y.
Shannahan, J. N., Pres., Omaha & Council Bluffs St. Ry. Co., Omaha, Neb.
Sloan, M. S., Pres., National Electric Light Assn. (Pres., The New York Edison Co., New York, N. Y.)
Storrs, Lucius S., Exec. Chmn. of Bd., United Railways & Electric Co., Baltimore, Md.
Tenney, A. B., Senior V. P., Charles H. Tenney & Co., Boston, Mass.
Tidd, George N., Pres., American Gas & Electric Co., New York, N. Y.
Wagner, Herbert A., Pres., Consolidated Gas, Electric Lt. & Pwr. Co., Baltimore, Md.
Young, Owen D., Chmn., General Electric Co., New York, N. Y.
Zimmermann, John E., Pres., United Gas Improvement Co., Philadelphia, Pa.

Press Comment on the Conference

No Small Promise

"Insull, of Chicago; Cortelyou, of New York, and Owen D. Young, of Europe, New York and everywhere, have seen the President. They and other industrial stars promise the President to cooperate in his admirable undertaking, promotion of new enterprises, wise spending of money and creation of jobs.

"Their promise is no small one, for they agree to spend eighteen hundred millon dollars on one program.

"What the country needs, if it really needs anything beyond common sense, is to spend part of the money we have, and we have hundreds of billions of it. On past occasions this country has stood petrified, unable to move, like a man watching his house burn down, unable to use his legs or hands."—*Arthur Brisbane, in his syndicated column.*

Eloquent Testimony

" . . . these . . . enterprises (public utilities and railroads) . . . are now relied upon, and not in vain, to assume the leadership in the movement to expand and stabilize the country's business and industry. Their importance as factors in the general prosperity could not be more plainly demonstrated. The immediate and widespread beneficial effect of their pledges of cooperation in the President's program emphasizes the folly of the indiscriminate attacks on these indispensable constituents of the Nation's industrial structure. For they, and not their professional critics, are the ones who today are helping to provide that 'action which counts' in promoting the material welfare of the country. . . . "there could be no more eloquent testimony of these shrewd business men's confidence in the industrial and financial situation than their unanimous decision to proceed with their forward-looking projects, involving even greater investments than in the year now drawing to a close."—*Philadelphia Public Ledger.*

Cooperators for Public Welfare

" . . . It (the conference) showed the people the vast extent of the (public utility) industry, gave new assurance of a mighty coordinated effort on a national scale to stimulate industry, and, what will be most important of all in the long run, showed the public utility men at their typical best as cooperators in a movement for the public welfare. . . .

" . . . The wholesome cooperation which the public utility men offered yesterday will in itself do a great deal to win public sympathy and create a better understanding of the relation of the vast industry to the nation, the states and the public."—*Boston Herald.*

Amplifier Talks to a Distinguished Guest

By AMPLIFIER

IT was about half-past ten one morning last fall when Paul S. Clapp, Managing Director of the National Electric Light Association, asked me to step around to his office. There followed the most interesting two hours I have spent in a long time. What he wanted was to have me meet M. E. O. Meyer, Directeur General Electricite de Strasbourg, a distinguished European visitor who had been making a tour of the United States. Having been called upon on various occasions to chaperon distinguished guests from other countries around the United States, I have always been interested in their reactions whenever they have been willing to talk frankly. M. Meyer was one of these.

TWENTY years ago he came to the United States. For two years he worked in a testing laboratory, then as a draftsman and finally as a designing engineer. Apparently he made it his business to inform himself fully as to working conditions of that time, becoming intimately acquainted with workers as well as with leading business men and financiers. In any event, he left the country two and a half years later enthusiastic over its future—a young idealist having firm and lasting impressions. When he decided to again visit the United States he feared, as he said to me, that he might be disenchanted.

After listening to M. Meyer telling about his experiences with light and power as well as with electrical manufacturing companies in New York, Schenectady, Pittsfield, Buffalo, Niagara Falls, Toronto, Cleveland, Barberton, Detroit, Chicago, St. Louis, Pittsburgh, Harrison, Newark, Philadelphia and Hartford it occurred to me that I might write a good story on his reactions. I didn't do anything about it however until Mr. Clapp received a letter from him. This letter was so interesting, and indicated so definitely what men of his type get out of a visit to this country, that I propose to take it together with my recollection of the things he said to me and give it to the electrical industry as something worth thinking about.

What seems to have surprised him most is the treatment he received in each one of these cities. Every question he asked with regard to management, engineering or operation was answered frankly, and, as he says in his letter to Mr. Clapp, "this broadminded way of dealing even with completely unknown visitors makes it possible to get in a few weeks' journey not just a thorough, but a very deep impression of what is done in your country."

Like almost every other European, and particularly those who spent some time in this country twenty or thirty years ago, M. Meyer was particularly struck with what he calls "progress in wealth." But, unlike most Europeans, his consideration of this question of "wealth" is not confined to simply increase in material things; it goes deeper than this, for apparently he considers wealth as something which is of value only because it makes possible the development of all sorts of other human activities. One of the first things he noted was that while the cost of living has "seriously grown during the last ten years," wages and salaries have been raised with even greater rapidity, "giving each individual a greater margin of expenses." This explains, to his satisfaction, "why nearly every family has an automobile, a radio set and many domestic conveniences." In his opinion, the general welfare of the people of the United States is due to what he calls "a closed circuit, remarkably developed in the States." Increased revenue means greater individual purchasing power, resulting in more business and greater production.

RECALLING that 18 years ago the light and power companies were having a difficult time, M. Meyer rejoices in the fact that they are now prosperous, because, as he says, "their aim has not only been to make money, but first of all to serve." He expressed the greatest astonishment over the length to which these companies will go to satisfy their consumers. To him the "large and expensive telephonic services," as well as the "important commercial and technical staffs" organized solely in the interests of the customers together with "large maintenance and repair costs," are responsible not only for the quality of the service given, but for the confidence of the public which the electrical industry in this country enjoys. He was enthusiastic over the design and equipment of power houses, substations and transmission lines, saying, that while they looked almost "luxurious," he appreciated that the huge expenditures involved make for stability and quality of service.

Again like most Europeans, he was surprised at the tremendous increase in buildings, and particularly "skyscrapers" in the larger cities of the United States, as well as the amount of home building which is going on. To him the response of the building trades to what he calls "the ascendent trend of industrial and commercial life" is remarkable, and he doesn't hesitate to assign credit to the electrical industry. "The electric light and power company," he says, "contributes, so to say, automatically to this development. Without electric light and power, and without steam heating, no huge and tall building is imaginable."

M. MEYER commented on the large scale development of electrical engineering. "The design of power plants," he said, "has brought about a number of important improvements permitting the most economical use of both water and coal. Twenty years ago no one would have dreamed of the present low coal consumption due to high pressure and high temperature, as well as to automatic control, of combustion." He feels, however, that in spite of the progress made during the past 18 years the problem of ash handling "is still susceptible of improvement," and that the question of "smoke suppression still leaves some field of research open." He also spoke of the size and capacity of turbines and alternators, as well as of arc welding, in the most complimentary terms.

"The general use of electrical energy everywhere, which I have noted during my trip," he said, "from the largest to the smallest workshop, through the commercial building to the private house, from cities out to the remote farm, gives one the impression that electricity is the most important factor in the modernization of living and working conditions. The consumer may claim that he offers the opportunity to the light and power industry to serve him, but the fact remains that electricity has been one of the largest contributors to the progress of American manufacturing, business and home keeping methods."

What he particularly appreciated, however, was the scientific manner in which the electrical industry goes about its work. "Engineering," he said, "is not based on routine, but on serious studies of well trained and scientifically brought up engineers. Compared with

Private or Government Ownership of Public Utilities

A Philosophical Dissertation on a Subject of Vital Interest to Everybody

By A. H. MARKWART

PART I.

THOSE aggressive minority groups which advocate government ownership and operation of public utilities raise a broad question of public policy, involving factors that vary according to how we view the subject. If we view it as a matter of national concern, one set of factors comes into play; if we view it as a State problem, another set must be considered, and if we view it as merely a matter of local concern, still another set must be applied.

The proposal of the advocates of government ownership to substitute public ownership and political operation for private capital and private initiative in the business of rendering utility service, is a radical departure from the traditions of American economic thought and practice. Consequently, the burden of demonstrating the wisdom and the economic soundness of the new or substitute method rests on those who advocate the change. The responsibility is upon them to prove that their methods are economically and politically sound, and that there is valid reason for expecting that service under the new system will be more satisfactory than it is under our present system of private ownership regulated by public authority.

In other words, all presumptions are in favor of private ownership and operation as against public ownership or operation.

I approach this discussion from a national and State, rather than from a community viewpoint, simply as an American citizen and observer, whose experience along lines of constructive activity has caused him to view problems concretely, rather than academically or abstractly. To me, the case history of a problem is more important than *a priori* theories. As an engineer, employing observation as a basis for judgment, I feel that the basic cause of our social and economic advance lies in the fact that it has been stimulated by individual need and ambition and guided by individual enterprise and initiative. It seems to me that the lavish contribution made to society by the intelligence, vision, and scientific imagination that has built up the utility corporations, and the facilities that have produced the marvelous results visible in America, is the justification of private ownership of public utilities under regulation.

Mr. Markwart is Vice-President in Charge of Engineering, Pacific Gas & Electric Company, San Francisco. This address was delivered in September before the Public Utilities Section of the Commonwealth Club, San Francisco

Nowhere is commercialism so dominant as in the United States, yet nowhere is there a greater degree of idealism, but this idealism is practical, rather than Utopian, consisting as it does of a spirit of service and an enlightened economic policy which combines low unit cost to the consumer, equitable distribution of reward to the mental and manual producers, and a return for capital appropriate to the risk to insure its continued flow to industry. This idealism, which permeates the whole of modern business, was not deliberately established, nor has it been consciously directed. It grew out of experience, and evolved, as did most of the institutions which favorably affect our economic welfare. It is one of the characteristics of the spirit of America, and is a concrete expression of the mass production technique of our times.

The proposal to establish government, in lieu of private ownership as an American principle is based fundamentally on the idea that a new industrial order is desirable. As a start, small groups are striving to have the scope of socialized control, which now covers such functions as postal service, education, police and fire protection, extended to embrace certain of our industrial activities, and particularly those which operate under our established and accepted regulatory system. It may be characterized as a minor trend toward collectivism, like that which obtains to the fullest measure in Russia and in part in Germany and Czecho-Slovakia and in certain cities of Europe, notably Vienna. In the United States, the government ownership movement is against the privately-owned public utilities, and of late especially the electric utilities, on the basis of community ownership, rather than State or federal ownership.

But utility operation, usually a highly technical commercial undertaking, in my belief is not economically adaptable to government control. Government management cannot escape political control; it cannot introduce that personal interest which is so essential to business enterprise; cannot eliminate the evils of democratic management; cannot produce a flexible internal operation; nor can it always obtain the support of the voter in financing for expansion, or secure the finest public relations and enthusiastic sales effort; nor has it been able successfully to coordinate and advance the technical phases, particularly in those utilities, notably the electric, the art of which is not fully stabilized. In other words, when promotion and reward go by political favor, rather than by merit, there is no incentive to invention and improvement; consequently the art and the service make no progress.

From Early Times

AS far back as the dawn of history, government has attempted to regulate the industry of individuals. Since earliest times, under varying economic and social conditions and circumstances, government has occasionally owned and operated the machinery of production, including agricultural, transportation, and mercantile enterprises. Road building and harbor works have been common examples of governmental activity.

Viewed broadly, the societies of antiquity were based upon human slavery and a vast proletariat. Owing to the insecurity of life and property, the individual lacked the incentive and was denied the protection necessary to the accumulation of private capital.

Thus we find the Egyptian governments supporting and encouraging, if not at times actually directing, agriculture and cattle-raising, the two principal industrial activities of the time, as a matter of State policy.

What Plutarch says leads us to surmise that Pericles caused many things to be done by the Athenian government: the construction of buildings for amusement and worship and other works which were monuments of glory to the State, in addition to various pensions, gratuities and diversions at the public expense.

Men ever have philosophized upon the ideal State. One may say safely that our modern disciples of government ownership are followers, to some extent, of Plato, who regarded the ideal State as one in which the individual is completely subordinated to the State, and community of property is established. On the other hand, those who support the institution of private property agree with Aristotle, who, opposed to the communism of Plato, advocated personal freedom, individual initiative and private property. The rationalism of Aristotle as compared with the idealism of his teacher Plato, marked an advance in Grecian economic thought during the lives and times of those great philosophers.

Because Rome was interested primarily in conquest and politics, her governmental enterprises were limited to the lending of money which had come into her coffers as tribute and to the receipt and distribution of food stuffs and plunder from her dependencies. Economic activity in the usual sense, excepting agriculture, therefore played but little or no part in Roman life.

In the medieval period, industry was an incident in a world dominated by theology and law, and economic doctrines were controlled by religious considerations. The taking of interest was condemned, the pursuit of wealth for the sake of having it was regarded as one of the seven deadly sins, and society seemed more concerned with the spirit than with the flesh.

With the sixteenth and seventeenth centuries there came a marked change in economic thought, and we encounter a number of writers speculating on the various factors that contributed to the promotion of the wealth of nations. People began to regard matters which affected a nation's finance and commerce separately from those relating to its politics and morals, though they were still confused in their ideas of private wealth as distinguished from public wealth.

The major economic philosophy of our own times is unmistakably that of individualism; the minor, that of collectivism, otherwise known as socialism, communism or syndicalism, depending upon the means advocated for changing or overturning the established order of society.

In the United States, where, despite marvelous economic achievement, we are still advancing, with natural resources still to be developed, optimism and common sense prevail, rather than the pessimism and abstraction which tinctured some of the schools of thought of the recent past.

Now the idea of enterpriser's profits is regarded by the majority of the people as sound and in the public interest, and the economic value of individual initiative is highly appraised. Yet, despite a tremendous accumulation of public wealth and its ready explanation, there is in this country today, oddly enough when we consider the principles upon which our government was founded, a group temperamentally inclined to the idea that economic salvation is to be had only through government ownership of certain of our production and service agencies. This group includes the so-called modern socialists of the several moderate types who would educate the people to a belief in government ownership, with a view to bringing this about by parliamentary methods, instead of through direct action.

National Ownership

THE tendency for government to do more than govern is not confined to the remote past. We might recall the provision in our Federal Constitution, to the effect that "Congress shall have the power to establish Post Roads and Post Offices," in order to secure the intellectual, social and material advancement of the people. While the national government has undertaken such enterprises to increase the stability and promote the welfare of the individual, it has never sought to increase or expand these functions in relation to transportation or communication. Our legislators had the power to develop these utilities, but have consistently refused to do so, either because such activity was not in accord with the American statesman's view of the functions of the federal government, or because the necessary incentive was lacking.

The obstacles to the nationalization of the public utilities seem almost insurmountable. Our very form of national government in its relation to State sovereignty stands as a barrier, when we recall the principles on which it was founded. The idea is un-American and certainly contrary to the thought of the framers of the Constitution.

The Constitution gives Congress the power to appropriate money to pay the debts, and to provide for the common defense and the general welfare of the United States. These three are the only purposes for which the public funds may be expended. Under this stipulation certain road, river and harbor improvement bills in the past have met with the Presidential veto on the score that they were not clearly for national, as distinguished from State or local, welfare. In such cases, encroachment upon the rights of States or individuals does not seem to have been the danger to be feared but rather local advantage and its trial of government patronage, and the tendency to run to Washington for those things which it is the duty of the States to provide.

If these things may not properly be done by our national government, we shall have to stretch our imagination to justify the opinion that it may administer the processes of production, buying and selling, particularly if we also take note of the constitutional provision that money raised by the government must come from "Taxes, duties, imports and excises." This may be interpreted to mean that the federal government has the power to raise needed money by any of the known methods of taxation, but not by trade.

Such a radical extension of the powers of the national government would be possible only after basic changes were made in the fundamental law and practices of our government. Such changes would have to be predicated upon a scientific examination of the very structure of the Nation, its history, customs, laws and institutions, and a careful inquiry into the relation between the Nation and the States, as far as they would affect, or would be affected by, such a revolutionary act.

As a practical matter, it is unlikely that the national government will ever undertake to render domestic water, gas, electric or transportation service, despite the fact that there is interstate business done in each of these, except water. It does render postal service, but it never has made a signal advance in communications, with the possible exception of the air mail service, and there seems to be no desire to postalize our private telephone and telegraph systems. On the other hand, the development and advance of the railroad systems, ocean navigation, wire and air communication, and gas and electric service, under private initiative have been beyond all expectations.

In justice to our government, which we love and esteem, let me say that obviously such development and advance could not be made by *any* government, because progress would be discouraged for lack of incentive. Forward movement must always be had through the individual who sees some form of gain as his reward for personal effort.

It is our American institutions, however, which have caused men to want to create these things and which have permitted them to accumulate their private wealth in their own way. Our federal government, in confining itself to the task of governing, has, in effect, voluntarily stood aside and encouraged individuals to make inventions and discoveries and to pool their business interests in great utility corporations. It allows these corporations to have personalities so that they, like men of enterprise, may exercise initiative in the hope of profit.

Indeed, the federal government has been most studious to avoid an invasion of the public utility field, undertaking such invasion as an incident only to a major project, the development of which was considered necessary to the promotion of the general welfare.

In illustration of the statement that the Federal Government is limiting itself to those things which affect the public welfare, the Federal Water Power Act of 1920 may be cited. The purpose of this legislation was largely to encourage water power development by others than the national government on the public lands and navigable streams over which Congress has jurisdiction. The Act was prompted by the necessity of correcting the intolerable situation at the time, by reason of indefinite tenure and possible arbitrary revocation, which practically prohibited private capital from venturing into water power development on national lands and waters. This Act is comprehensive but not objectionable, since it makes no radical extensions of the functions of our national government, while it protects the public interest and permits the use of federal property for the development of water power on terms that are acceptable to private corporations and individuals.

State Ownership

STATE ownership of public utilities or other agencies of production and buying and selling has never become permanently established. Nevertheless, on many occasions and in many States efforts have been made to use the credit of the State to accomplish the building of railroads, a movement that went back to the years before the Civil War. In other instances, the credit of the State was loaned to private individuals to encourage the building, by them, of railroads. The general result of these ventures was failure, and, where the properties could not be leased to private operators, they were sold at large financial loss. All of this activity piled up debts and destroyed the credit of the States until some, over-burdened with obligations, resorted to repudiation.

This orgy of spending State funds and pledging State credit for railroads had its reaction in the writing of new constitutions or the amendment of old ones in almost every State in the Union, certain New England States excepted. A check was provided which thereafter prevented legislators from squandering the public funds on widely conceived schemes and from the creation of debt in the absence of specific constitutional authority. Most State constitutions, like the Federal Constitution, today provide that no debt shall be incurred by the State except to pay existing debts, to suppress insurrection and to repel invasion or defend the State in time of war. In a word, the State's credit and money are to be spent solely and only for the purposes of government.

The State of New York persists in operating the Erie Canal system at a huge annual loss, but this business failure did not deter the State of South Dakota from going into a number of commercial enterprises which failed. Despite the unfortunate experience of these and other States, the State of North Dakota undertook to carry on the flour milling and grain elevator business, and other less spectacular but equally speculative undertakings, with disastrous results.

Port development has taken place under State ownership, and there seem to be special reasons which justify the entrance of a State or city into this field. California with its Port of San Francisco, and Louisiana with its Port of New Orleans, are cases in point.

Most of the recent agitation for State ownership relates to water power. This question in various forms has been defeated year after year in New York, Maine, Idaho, Georgia and Michigan. An effort to write the State ownership of water powers into a new State constitution for Nebraska failed. In California three attempts were made to obtain the approval of the voters to the so-called Water and Power Act, by which it was proposed to take over the electric utilities, but each attempt met a decisive veto from the people. A similar measure in Oregon was likewise defeated. The disinclination of voters to approve State enterprise in this direction is a powerful deterrent to State ownership of utilities. There has been no public need for States to embark in the public utility business, √ and no good reasons have been developed by proponents to justify adding billions of dollars of tax-free bonds to the billions already issued.

Search does not reveal any evidence from which one could conclude that there is a strong or general desire for States to enter the public utility field, in the water, gas, electric, communication or railroad businesses, in competition with private corporations.

Municipal Ownership

MUNICIPAL ownership of public utilities and other business enterprises has gained a foothold here and there. The 1925 municipal index (last census) of 1481 cities of over 5000 population, shows 2510 public ownership undertakings. These range from water, gas and electric plants and street railways down to garages, comfort stations, steam laundries and ice manufacture, mostly small enterprises.

This extension of the functions of municipal government to the acquisition and operation of business enterprises, particularly electric, gas and street railway utilities, is attracting attention in the United States, and giving some concern to many balanced thinkers who perceive the fallacies and perils which lie in this movement. In England, this extraneous expansion of government is called municipal trading, and the cause is ardently espoused by George Bernard Shaw and his Fabian Society. Like their brothers in England, the propagandists of government ownership in the United States finally selected that field which to them seemed most fertile in which to sow the seeds of their theories. Collectivism has failed as a canon to conjure by, so far as our national and State governments are concerned. Accordingly, the leaders of the movement have directed all their batteries on the municipalities, large and small. It is a curious anomaly that there should be any following whatever of the British practice of municipal trading, which has been financially unsound and a menace to British progress and society.

Municipal Water Works

By far, the predominating municipal activity is the public water supply. Of all the cities and towns of more than 5000 population, 75 per cent own their own water works. A few cities still have privately-owned systems, though it is but a matter of time when these will be taken over by the municipalities. The reason why municipal operation of water works has not failed is that there is no substitute for water and the business is comparatively simple and is noncompetitive. Private enterprise in water distribution has been equally successful, except to the extent that it has been hampered by taxation and political regulation.

Municipal Railways

The measure of success which has

attended municipal ownership of water supply has not been repeated in the ownership and operation of railway systems.

Aside from the classic failure of the City of Cincinnati, with its steam railroad to Chattanooga, municipalities have essayed but little in the steam railroad business.

Municipal ownership of street car lines has not taken on serious proportions, less than 2 per cent of our 1500 odd cities of 5000 population and over having embarked upon such enterprise. Despite the reduction in gross revenue, as a result of the introduction of individually-owned power-driven vehicles, most of the mileage of street railways is still in private hands. Since 1918 the City of Seattle has been carrying a white elephant in the shape of a "municipal railway" which is a serious tax burden to the city, despite a ten-cent fare.

The San Francisco situation is unique in that it is one of the few systems still operating on a five-cent fare, and in competition with privately-owned lines. Should the city take over the private company, it is to be expected that the fare will be raised. At the present time the private company is not receiving a fair return on the value of its properties after paying its taxes, nor is the city, though free from taxes, properly taking care of its depreciation reserves, notwithstanding the fact that in many particulars San Francisco is an ideal street car city.

Municipal Gas Plants

The growth of the gas industry, one of the oldest and strongest of the privately-owned public utilities, has since its birth in 1816 kept step with the national expansion. Of the tremendous production of manufactured gas throughout the country, but 1½ per cent is furnished by municipal plants, and 80 per cent of this 1½ per cent comes from the Omaha, Richmond, Va., and Duluth plants. The private gas companies are firmly entrenched as essential enterprises and are capably managed. As a result of this favorable situation and splendid public relations, the development of municipal ownership of gas service has not been extensive.

The principal Pacific Coast municipal systems are in Arizona and California. In Arizona the municipal works are at Miami, Winslow, Mesa and Tempe, the latter two distributing only. In California there are Ukiah; Palo Alto, with distribution only; and Long Beach and Coalinga, employing natural gas. The sales of gas, natural and artificial, by municipalities in California in 1928 were between 5 and 6 per cent of the California total, and Long Beach made substantially all of these sales.

Municipal Electric Plants

As in the gas business, private ownership dominates the electric field. In 1925 there were 337 municipal plants in our cities of 5000 population and over. Most of them are in small communities with small and less complicated demands, but there are a few large undertakings, which, as the proponents say, "stand out as shining examples of government ownership."

The best available statistics indicate that less than 5 per cent of the total electric production is from municipal plants. Yet with only 5 per cent of the total production, the municipal plants employ about 10 per cent of the fuel used. This situation is not alarming were it not for municipal ownership outbreaks from time to time in the larger communities.

Owing to the lack of economy in the smaller systems, particularly where generation is involved, the unit costs are high. As a rule, the larger and more modern and efficient plants, and particularly the steam-electric plants, are in private hands and serve the larger fields. These have a marked advantage in capacity factor and hence in economy over the smaller municipal plants serving small local areas.

Fifteen years ago there were hundreds of municipally-owned electric plants in the Southeastern States. Today there are but few, by reason of the ability of private companies, with interconnected systems, to offer to the municipalities rates for service that are actually lower than the unit cost of producing and distributing electricity by their municipal plants, which were old and often obsolete. Each year records a lessening number of municipal plants in this section.

The same situation obtains in the Middle West, in Kansas in particular. During the year 1927, eighteen cities in the State of Kansas disposed of their municipal light and power plants and nearly 100 other cities of that State had done likewise during the preceding five years. Not only have the cities been junking their plants wholesale, often before the retirement of the bonds issued to pay for them, but in several instances they have paid substantial bonuses to privately-owned companies to take over their systems and guarantee light and power service. The chief reason for the decline of the municipal light and power industry in Kansas has likewise been more satisfactory service at less cost from private companies.

In Kansas City itself it was recently ascertained that the municipal plant, which had supposedly been operating on a profitable basis, was actually operating at a loss when proper account was taken of depreciation and other items.

The City of Cleveland operates a municipal plant in competition with a private company, and, while the private plant has expanded its business very rapidly, the municipal enterprise has stagnated.

The City of Seattle has an extensive generating, transmitting and distribution system involving hydro-plants on the Skagit and Cedar Rivers. The City of Tacoma has done likewise with hydro-plants on the Nisqually River and at Lake Cushman. Following their examples, Aberdeen some six years ago voted bonds to start the construction of a hydro-electric development on the Wynooche River and to take over a privately-owned steam plant and distribution system. These projects in some way became involved so that it has never seemed wise to the City Council to pursue the matter further, and they will probably never be revived.

Curiously enough, considering the great strides made by the electric industry in California under private control, this State has some municipal ownership in the electric utility business. Its two large cities, Los Angeles and San Francisco, have made heavy capital expenditures related to electric service, although San Francisco has many more engagements and commitments of greater public concern than electricity to meet, which will act to postpone further investments for this service; and Los Angeles has fallen far short of realizing all of its early hopes, since it has no monopoly and generates but a part of its supply.

The smaller communities of Alameda, Palo Alto and Redding, and a number of others, own electric distribution systems, but do no generating, except Palo Alto, which produces a little by means of a Diesel engine plant, but does not expect to enlarge to meet growth.

The public utility companies in California made approximately 88 per cent of the total net kilowatt-hour sales, with municipal plants selling the remaining 12 per cent.

General Economic Considerations

To summarize the present situation, national, State and municipal, it may be said that the movement toward government ownership is practically limited to municipalities and that while the public water supply is most generally community owned, only the smallest electric plants are so owned, if we except a few large cities such as Seattle, Tacoma, Los Angeles, Kansas City and Cleveland.

As has been said, certain kinds of undertakings have engaged the attention of government since times immemorial, but the social, ethical, political and economic conditions which prevailed in the past were vastly different from those today, which are such as do not justify the extension of government. To the contrary, we feel that the conditions in these respects and the things which have been favorable to our welfare, justify a minimum of government participation.

As this analysis proceeds, certain elements are seen to be outstanding in their bearing upon the question of municipal ownership, among which are the broad economic considerations, such as public wealth, corporations, public utility monopoly, and factors which influence service charges, including taxes and profit. These may perhaps best be discussed in regular order.

Public Wealth

The production of wealth in the United States has increased more rapidly than the population, and no country excels it in material prosperity. A reason often advanced for this increase and preeminence is the use by the American people of power-driven machinery. While it is true that mechanical power has replaced human labor in large degree during the last fifty years, we cannot overlook the essentially fundamental part played by the corporate institutions which characterize our national economic life and have done so much toward enhancing the public wealth. The established order, methods and customs of this country encourage private initiative, guarantee the individual the possession of the fruits of his endeavor, and hold inviolate the sanctity of private property. Private ownership, with its skillful management, is the basic cause of this prosperity.

Hadley defines "public wealth" as the total of private wealth and government property. It is inconceivable that the enormous accumulation of public wealth which exists in this country could have resulted under other than a capitalistic system. The capital which has been recruited periodically from our private wealth to develop instruments of production, despite waste at times through division and dissipation and by injudicious application, has created additional private wealth; but through the agency of mass production and by reason of the efficiency of private endeavor in the hope of private profit, society has not had to pay more for commodities supplied and services rendered, through the agency of private property, than it would have paid in the long run had they been supplied and rendered by public property. In other words, that portion of our public wealth which has been privately managed to render service to the public has produced a surplus which would not have been realized had government managed it for the same purpose.

Corporations

Today, costs are kept to a minimum through mass production, and this has been possible only through corporate organization. The individual, working single-handed, cannot produce the volume of material or give the service required by modern industry and society. It must be remembered that the second half of the nineteenth century was signalized by a stupendous development of industry in which the forces of production and distribution were revolutionized. Society and its industrial enterprises demanded utility services at so accelerated a rate that vast combinations of capital had to be employed to create the hugh utility systems necessary to satisfy these demands. Capitalistic production created the large private utility corporations which we now have under regulation by the State.

Perhaps it is because these utilities are corporations, rather than individuals, and because they are gigantic in capital scope, that the group to which we refer is disturbed. Nevertheless, by virtue of its charter, such a corporation possesses what might be termed a personality and has certain rights and privileges in exchange for which it has assumed certain statutory burdens and accepted certain regulations. It is admirably designed to satisfy the requirements of a vigorous modern American commercial and industrial society, the keystone of which is personal freedom.

Public Utility Monopoly

Economists define public utilities as natural monopolies of organization, being those businesses, not regulated by competition, whose expenses of production show a steady tendency to fall as the size of the business grows.* Among such businesses competition can have but one result, combination; and monopoly once established can maintain itself indefinitely because it can conduct its large scale operations more cheaply, and therefore sell more cheaply, than any small scale competitors that may be tempted into the field.

With this definition of public utility monopoly before us, and considering that the essence of any kind of monopoly is such control over the supply of a commodity or service as will enable the monopolist to regulate the prices thereof, is it in the public interest to have these kinds of natural monopolies in private hands, even though the alternative were public ownership with its well known drawbacks? Were it not for two prime circumstances which have combined to safeguard the user of these utilities, the answer to the question would have to be in the negative.

These circumstances are:

First: That despite the upward trend of commodity prices and wages for many years, the public utilities, in the belief that the interests of both consumer and utility are best served by the lowest possible rates, have never advanced their rates proportionately, and in most cases have lowered them.

Second: State regulation in most of the States has taken from the monopolists in these particular cases the power which they would have had in greater or lesser degree, to compel the public to pay for those services higher prices than would be needed to cover the expenses of production and the wages of capital and management.

In view of these two circumstances which both work in the public interest, and each of which by itself would justify private ownership, we may say that private ownership and control is in the public interest, in spite of the tendency toward natural monopoly. Regulation, of course, would prevent rates from becoming excessive, even though increasing costs required higher rates.

Note: The second and concluding installment of this article will appear in the next issue.

*Includes all utility business except telephone, which is not subject to law of decreasing expense, but with it competition is the exception rather than the rule.

Routine Distribution of N. E. L. A. Committee Reports

and How Additional Copies May Be Obtained

By A. Jackson Marshall

IN a previous article dealing with N. E. L. A. Committee Reports (N. E. L. A. Bulletin, November, 1929, page 722-724) it was explained that because past experience has proved the futility of attempting to keep an accurate report mailing list of individual names, reports when published are mailed to member companies with a sticker directing the report to the company's chief executive officer, in the cases of Special, General and Public Relations committees. Other reports are directed to the company's Accounting, Engineering or Commercial chief executive concerned. The colors of the stickers used are blue for Accounting; pink, Engineering; red, Commercial; yellow, Public Relations; green, Special and General committees.

This mailing to member companies accounts for a large majority of the 3000 to 3300 copies used in the routine distribution of each report by Headquarters.

Copies of each report also are sent to geographic division and state association officers, and to the following: Public Utility Information committee directors, State Public Service Commission secretaries, trade and technical press, and upon request to public and college libraries, and engineering and business schools.

In order to keep geographic division committees informed of the work of the corresponding National committees, sufficient copies of each National committee report are sent to each divisional secretary, for distribution through their offices to members of corresponding geographic division committees.

In addition to the above general distribution, National committee reports are sent to officers of the N. E. L. A., and to executives of the National section concerned. Two copies of each report are sent each member of the committee responsible for its preparation. All reports have similar distribution. An example of distribution is shown in Table I. (Third column.)

Many member companies require additional copies of National committee reports to supply those or their personnel concerned with the various subjects covered by the reports. To fulfill such requirements promptly, standing orders are placed at N. E. L. A. Headquarters for committee reports so that a member company desiring a certain number of additional copies of each report, or reports of only certain committees, receives automatically upon the publication of such reports the quantity desired as specified on the standing orders. To facilitate the placing of the standing order by a member company for such reports as may be desired, separate standing order blanks have been designed for reports of Accounting, Commercial, Engineering and Public Relations National Section committees. A standing order form for an Engineering Section committee report is reproduced in Fig. 1. (Next page.)

Mr. Marshall is Secretary of the Association. This article, the second of a series on N. E. L. A. Committee reports, explains the routine distribution of reports; also how companies may obtain quantities for distribution to their personnel and how individuals may obtain single copies.

It will be noted that the order blank not only lists the various committees of the Section, but also Special and General committees whose activities are related to the Engineering National Section committees. Thus a company desiring copies of reports of the Hydraulic Power Committee of the Engineering National Section would, no doubt, desire reports of the Water Power Development Committee, the order for which could be indicated on this same form. A similar listing of related committees appears on the standing order forms for reports of other Sections.

Whenever quantities of reports are ordered by a company for distribution to its personnel, they are sent to one person, whose name is to be indicated in the space provided on the order blank, for distribution within the company. Standing orders also are placed by individuals, and in such cases the reports are mailed direct to them. Duplicate standing order blanks for the company's file accompanies the original.

Although the standing order procedure has been but recently developed, approximately 700 companies and individuals have standing orders for National Committee reports on file at N. E. L. A. Headquarters. These vary from orders for one report to orders for two copies of all reports published.

Author's note—You don't have to have a talent to make a living by writing a column; all you need is a steady income from some other source.

Woman's Opportunity in the Electrical Industry

By ALICE M. BAKER

MINE is no longer "the voice of one crying in the wilderness," for actual experience during the past year has shown the work of the Women's Committee to have gained the attention of an increasing number of executives. These leaders of our great electrical industry have given their sanction to the continuance of our educational program. In maintaining that the work of the Women's Committee is largely educational, we can agree with Samuel Butler that education has become more than a science; it is a craft, for he said: "Don't learn to do, but learn in doing."

I like to think it is by and through our jobs that we become educated. Education raises people above their surroundings and makes them masters of themselves rather than creatures of circumstances. It is not enough merely to know how to get a living; it is necessary to know how to live. In other words, one wishes to be known for what he "is" as well as for what he "does."

Lena Madsden Phillips, President of the Business and Professional Women's Club, recently said that there exists a man-drawn deadline beyond which women cannot pass in business, politics, the professions or any other competitive pursuit, which almost amounts to a conspiracy to halt the advance of women upon the long-held domain of man in business.

BUT in sanctioning the work of the Women's Committee, I see the opportunity given to women in the utility industry, at least, to prepare themselves if they choose to do so, to take up the responsibilities of business when and if the door of opportunity opens.

I see in such sanctioning of our work the opportunity to become increasingly useful to the industry. Our constant aim is to show the woman employee that she has the opportunity to live her life right in her daily task; that in many instances her opportunity is her present job, only she does not recognize it. The real difference between people is not in their chances, but in their ability to recognize these chances. They come in one form or another to every one. Probably no one ever lived whose hand at some time has not been at the door of genuine opportunity. The trouble is that we do not see it, because it comes to us in some other form than we had determined in our minds that it would come. Opportunity wears the simplest dress. She hides herself behind the simplest disguises, so for the most part we pass her by as a commonplace thing. Opportunity comes in such fashion that our reception of it determines our fitness to use it. Those who succeed are open-minded, alert to discover the true value of things. They take everything at its best and use it for its highest. So there lies at the bottom of every right use of opportunity a noble quality of character—that quality which takes life as a thing full of noble chances of growth and progress. So, women of the utility business, we need not a new chance, but a clear vision to discern the chance which at this very hour is ours for the taking.

Miss Baker is secretary to the president of the Hartford Electric Light Co., Hartford, Conn., and a past chairman of the New England Division Women's Committee. This address was made before a meeting of that Committee at New London, Conn., September 11, 1929

This opportunity for development has come only within very recent years, for it was not many years ago that we heard the expression, "Breaking men while making money." The human race has now developed so that management today says, "We are making men and women while we are making money." Such a thought denotes the march of progress. This age of power—this electrical age has developed a new type of leadership in business and following in the footsteps of that outstanding man of these times, Owen D. Young, business is becoming a profession. At the present, men are bringing to their work an enthusiasm and interest which are not caused or measured entirely by profits. The modern hazard in business is mental, not physical. Business has become intellectual, and calls for the same quality of mind that once made generals and priests. Dr. Johnson had some idea of this when he said, back in the 18th Century, at the sale of a brewery, "Gentlemen, we are not here to sell a parcel of boilers and vats, but the potentialities of growing rich beyond the dreams of avarice." The same thought is in the minds of electrical leaders today who are saying: "Gentlemen, we are not here to sell a block of kilowatt hours, but the elimination of drudgery to a completely electrified country."

RECENTLY Henry Ford expressed it thus: "The use of electricity is yet little to what it will be during the next ten years. We must enlarge our conception of its use so that the power that comes over the wire may be as common as air and universally used. Corralling the sources of power and doling it out is not the way. We must provide power so lavishly that it will become cheaper to use it than not. It is to be done by giving more and more electricity for less and less money, and by teaching how these great quantities can be used profitably and with benefit in every direction. The biggest job before the utilities is to get electricity into the minds of the people. Create a desire for what electricity will do for them. They need only to be shown how tremendously much more electricity can offer them if they will only let it."

We women are arriving on this scene riding on the crest of this wave. What are we going to do with such a situation? First of all, I think we are going to learn the facts about not only our own jobs, but the relation they hold to the work of those associated with us. Unless one is in work of which he feels himself a real part he cannot fully attain happiness. The work we are doing should be recognized as a telescope through which realization of our ambitions may be seen. In order to work willingly, one must work because he desires to work from within, not because he is forced to carry out orders given

James H. McGraw Prize Paper

Operating a Hydro-Electric System for Best Economy

and Means Employed for Checking Performance of Operation

By E. B. STROWGER

IN recent years considerable attention has been given to the economics of both hydro-electric and steam-electric power plant operation. In the case of the steam plant the resource is usually a physical coal pile which represents a large expenditure of money and the conservation of which is very apparent in its relation to profits. In the case of the resource of the hydro plan, the tendency in general has probably been to have a less rigid system of accounting. In the latter case the production of electrical energy per cubic second foot of water varies with the gate-opening of the turbine and also may change in value for a given gate-opening through wear or perhaps pitting or mechanical depreciation of some kind. To maintain the plant so that a maximum of operating efficiency is possible and to operate it in such a manner that a maximum of production is realized, is the only means of making the utmost use of the available resource. This is the object of the engineering and operating departments of the hydro-electric company and justifies careful study, comprehensive tests to determine machine characteristics, and a vigilant check on the actual operation of the plant to make sure that it is operated in conformity with a predetermined schedule of load distribution.

Hydro engineers and operators have focused their thoughts to a great extent upon efficiency and economy in trying to compete with the improvements which have rather lately been made in steam-electric generation. The latter improvements have been made in large measure by increasing the efficiency of the power plant equipment.

Although hydro plants have already attained such high maximum efficiencies that there is considered to be little left in the available range of improvement, it should be remembered that the actual realization of this high rate of generation for a large proportion of the time of operation is quite another consideration. Operation at this most economical point for given system conditions may involve operating a hydro unit at a point considerably beyond the point of maximum efficiency. For instance, later it will be shown that three 70,000-hp. hydro units installed in one station, which is operated in conjunction with two other stations, should be operated at from 8 to 16 per cent beyond their points of maximum efficiency, for the average condition of operation with the water resources available. The three stations referred to are progressive developments at the same site, formerly known as separate stations and now called the Schoellkopf Station of The Niagara Falls Power Company. Reference will be made to the three sections of the Schoellkopf Station as Station 3A, 3B and 3C.

Mr. Strowger's paper won the James H. McGraw first prize award for 1928-1929. The author is assistant Hydraulic Engineer for the Niagara Falls Power Company. He entered the employ of the Niagara Falls Company in 1919 as draftsman and designer. In 1918 he graduated from the University of Rochester with the degree of B.S. in M.E.

An analysis of the economic operation of this plant and a description of the means employed for making reasonably certain of a maximum production for the given resources will serve as an example to emphasize the importance of the above statements.

Benefits from testing and from keeping records of plant discharge

The benefits accruing from a comprehensive testing program and from keeping records of plant discharge, as well as records of the kilowatt output, have been quite generally recognized among members of the industry. Increased attention has been given to this subject in recent years along with the general policy of conservation of resources. The steam plant has had for a considerable time a testing department for measuring resource and disposition thereof.

Description of the Schoellkopf Station

Stations 3A, 3B, and 3C, referred to above, are under one roof and contain units of very different characteristics. A general plan of the three stations is given in Figure 1, as is also a profile of the 3C development. The 21 units installed have ratings as given in Table I.

Station	Average Gross operating Head Ft.	Unit No.	Rating of Turbine h.p.	Rating of Generator kv-a.
3A Exciters	212	3, 8	1,000	1,000
3A—A.C.	212	1, 2, 4, 5, 6, 7, 9, and 10	10,000	8,000
3A—D.C.	212	11, 12, 13 14 and 15	10,000	8,000
3B	217	16, 17, 18	37,500	32,500
3C	217.5	19, 20, 21	70,000	65,000

TABLE I

The average allowable diversion for all units is 20,000 cu. ft. of water per sec., limited by governmental authority and not by available river flow. The operating gross head does not vary far from the value corresponding to mean river stage, as given in Table I.

Load Distribution among Identical Units in a Station

The study of economic load division among units in a hydro station is quite simple in the case of units identical in design. Such a study in the case of a station having different types of units is somewhat more complicated and in the case of load distribution among units of various stations, all of which may have different characteristics, may prove to be somewhat involved, but also may prove to be interesting.

Figure 2 gives the relation between power and discharge for the A. C. section of Station 3A for various numbers of units operating, all units being of the same design. The heavy line indicates the number of units to be run at any given station load for best economy.

tions 3A and 3C are given at the bottom of Figure 3. Above these the average kw. per c.f.s. curves are drawn as are also the two incremental efficiency curves (labelled △ kw./ △ c.f.s.) for units 19 and 21. A part of the kw. per c.f.s. curve and also of the △ kw. per △ c.f.s. curve for Station 3B is given in the enclosed section of the figure. It is evident that the use of water in Station 3A is the least efficient, the kw. equivalent per c.f.s. being about 14.97. The 3C and 3B station should, therefore, assume loads to the point where the incremental use of water falls to 14.97 kw. per c.f.s. before Station 3A is put into operation. If it is necessary for Station 3A to carry a load, then the distribution among the units should be in accordance with Figure 2, the station load being equally divided among the units loaded.

To find out the best distribution of an average available water supply of 20,000 cu. ft. per sec., reference is made to Figure 3. This is a problem of water dispatching. Allowing 10 c.f.s. for waste, 65 c.f.s for excitation of units 3 and 8 and 2558 c.f.s for the firm D. C. power of 3A, a balance of 17,367 c.f.s. is available for the A. C. system. Loading 3B and 3C stations to the point where the incremental use of water begins to equal the best average use through Station 3A requires approximately the following loads:

	Kw.	C.F.S.
Station 3B (3 units)	77,500	4,757
Station 3C		
Units 19 and 20	96,000	5,758
Unit 21	54,000	3,237

These loads are determined by the intersections of the △ kw. per △ c.f.s curves and a horizontal line through 14.97 as indicated by dotted lines. The water resource left available for Station 3A is 3,615 c.f.s., in accordance with Figure 2, should be divided among 7 wheels producing about 54,000 kilowatts. The maximum efficiency points for units 19, 20 and 21 are at loads of 41,000 kw., 41,000 kw. and 50,000 kw. respectively, so that for the average condition of operation these units should assume loads in excess of these values by about 7,000 kw., 7,000 kw. and 4,000 kw. respectively. In the case of units 19 and 20 this means that these units should operate for best economy at points where the overall unit efficiency is about one per cent under the maximum possible value.

Load dispatching which is an ever present problem for the load dispatcher involves the same factors as does water dispatching if economy is a consideration. Table II is a small section of a large table giving for any demanded load the proper distribution of load among the various stations. Table III is a portion of the operating table for loading the units in Station 3B after determining from Table II the total load to be carried in 3B.

Schoellkopf Station
Distribution of Load between Stations
3A, 3B and 3C

Total	Kilowatts Station 3C Unit 21	Units 19 and 20	Station 3B	Station 3A-(A.C.)	Diversion C.F.S.	Increment
310,000	57,000	112,000	81,000	60,000	19,327	72
311,000	57,000	113,000	81,000	60,000	19,399	72
312,000	57,000	114,000	81,000	60,000	19,471	73
313,000	57,000	114,000	82,000	60,000	19,544	73
314,000	57,000	115,000	82,000	60,000	19,617	73
315,000	57,000	116,000	82,000	60,000	19,690	74
316,000	57,000	117,000	82,000	60,000	19,764	74
317,000	57,000	118,000	82,000	60,000	19,838	74
318,000	57,000	118,000	83,000	60,000	19,912	75
319,000	57,000	118,000	84,000	60,000	19,987	75
320,000	57,000	119,000	84,000	60,000	20,062	75

TABLE II

Assuming a load of 315,000 kilowatts is to be generated by the Schoellkopf Station not including the D. C. units, then from Table II the loads to be carried by 3A, 3B and 3C are 60,000 kw., 82,000 kw. and 173,000 kw. respectively. The consumption of water will be 19,690 cu. ft. per second for this load. Station 3B will divide its load equally among three units as would be shown by the completed Table III, 3A in accordance with Fig. 2 will have its load divided equally among eight units and the load of 173,000 kw. taken by 3C will be divided between units 19, 20 and 21 in the order of 58,000, 58,000 and 57,000.

Station 3B
Water Consumption for Various Loads Showing Best Distribution of Load Among Units in Station 3B, Loads to Be Equally Divided Among Units Operating

Kilowatts	C.F.S. 2 units	3 Units	Number of Units for Best Operation
54,000	3,333	3,372	2
54,500	3,369	3,400	2
55,000	3,405	3,426	2
55,500	3,442	3,453	2
56,000	3,478	3,479	2
56,500	3,517	3,506	3
57.000	3,555	3,533	3
57,500	3,593	3,560	3
58,000	3,633	3,586	3
58.500	3,673	3,613	3
59,000	3,716	3,640	3
59,500	3,760	3,667	3
60,000	3,803	3,695	3

TABLE III

Charts and Records of Operating Department

It is quite general practice to take readings of many power house instruments every hour or perhaps every half hour. These readings are recorded in the station log book either in the power house or transmitted by telephone to a central point where a general log book is kept. Records including kilowatt output, water levels, and perhaps gate opening, may to advantage include discharge quantities and thereby prove valuable for the demands of dispatching and in general for cases where both deliberate and instant use are made of them.

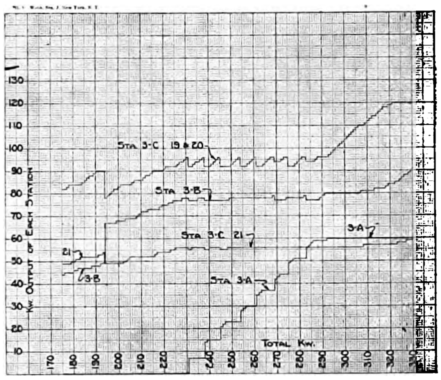

Figure 4
Chart for dispatching load — Schoellkopf Station.

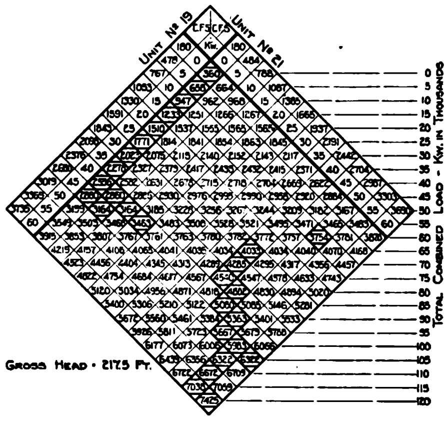

Figure 5
Diagonal chart designed for load dispatching when two units only are involved.

The rating and loading tables for this purpose are used by both the local operator and the dispatcher.

In the case of both Tables II and III it should be noted that the values of operating gross head used are those given in Table I and are for mean river stage. The variation in head from this mean value is relatively small so that the one set of tables is sufficient for all times. However, if the case at hand involved a variation in head which was large in proportion to the total average head then it would be necessary to make a family of curves or a set of tables for as many intervals of head as is desired within the operating range.

Sample charts for load dispatching are given in Fig. 4 and 5. The former gives in graphical form the same information as the completed Table II would give. Fig. 5 is a diagonal chart designed to give proper combinations of load for a two unit station and was made up for a hypothetical station containing two units the same as Units 19 and 21 referred to above. The square in the top diagonal column shows the cubic feet per second of water required by the unit indicated and for the load given in the second diagonal column. The figures in the remaining squares give the discharge in cubic second feet

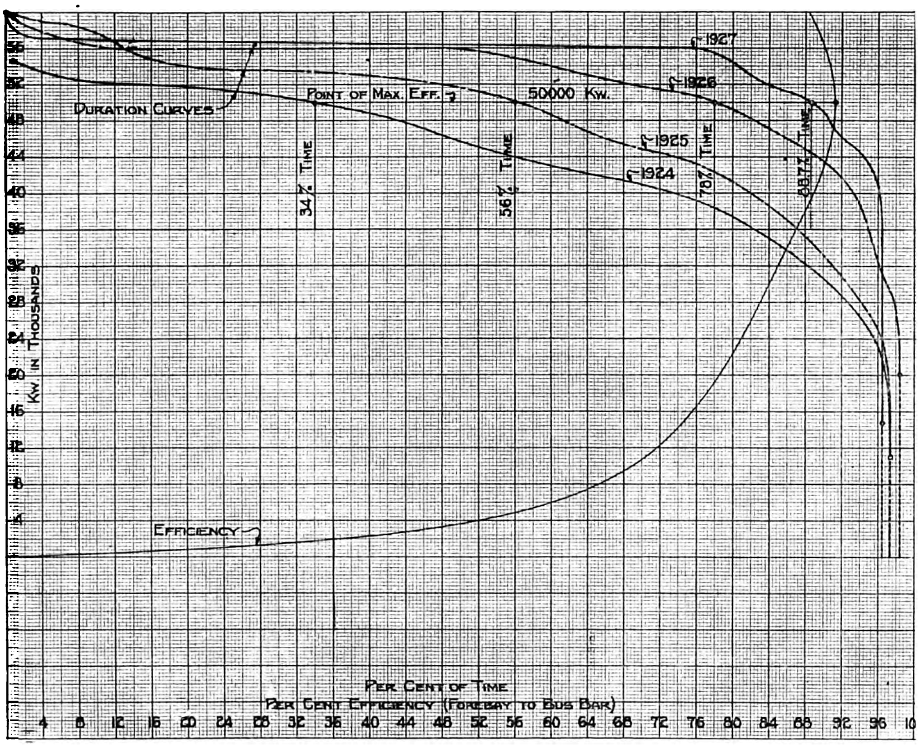

Figure 6
Load duration curves and efficiency curve for Unit 21 of Schoellkopf Station.

required by operating the two units at loads indicated by the respective diagonal coordinates followed to the second diagonal columns and are obtained by adding the figures in the corresponding squares in the first columns. All possible combinations of loads are indicated. The vertical column to the right gives the total combined load in the two units. A horizontal line from any combined load intersects a row of squares giving any possible combination of loads for the given total load. The lowest figures of the squares intersected indicate the best load distribution and the diagonal coordinates then give the corresponding loading for each unit and also the water consumption. For easy use, the squares for the best combinations of load are made prominent.

Other charts of a similar general nature to the ones illustrated may be designed which take account of the characteristics of the units involved and the vagaries of the local system.

Maintaining the Units at High Efficiency

Mention was made of the lowering of the rate of production, or the efficiency, by wear or pitting or by any mechanical depreciation of the turbine. A progressive schedule of inspection and overhauling, based upon experience with the individual types of wheels, will limit this depreciation. In the case of 3A Station where the turbines have horizontal settings, each unit is thoroughly repaired at least once in two years, and in the case of 3B and 3C one overhauling in five years is all that is necessary to maintain the wheels in their original condition, as has been determined by frequent tests. Periodical tests determine the effect of wear and pitting upon the efficiency of the unit and are prerequisite for an economical schedule of repair as well as one of load distribution.

Disposition of Resource

One method of checking the actual economy of operation of the plant is to analyze periodically the resources and the disposition thereof by means of an operating balance sheet. This method is described by G. R. Shepard in an article entitled 'The Balance Sheet' Idea Applied to Power Plant Operation" (N. E. L. A. publication No. 278-34). It accounts for all of the potential energy in the power site, giving the value of energy in dollars, and rigidly accounts for all losses since the total of the losses and the energy produced must equal the total resource. One of the detailed losses to be considered is the loss due to "operation," which includes unavoidable or careless operation and also inability due to local conditions to operate in accordance with the preferred loading schedule. Monthly balance sheets, summarizing and allocating the daily losses and their evaluation and also summarizing the production of energy, are made. These monthly balance sheets are mutually comparable and may be related to the predetermined ideal balance sheet of operation. In this manner the analysis shows how closely the operation of the stations approached the ideal.

Application of a Duration Curve to Power Plant Operation

A second and very useful check on the actual operation of the plant may be obtained by means of a duration curve of operation. A sample curve is given in Figure 6, which shows for Unit 21 of Station 3C the duration of time the unit was operated at, or above, a given load, for the years 1924, 1925, 1926 and 1927. Year 1924 was the first year of operation and since that time it is apparent that the unit has been operating at a greater per cent of time at the most efficient range of loads, the most efficient range being located at, or near, the higher loads as indicated by the relation between overall efficiency and output given on the same figure. In other words the actual operation of the unit has been approaching the ideal as determined from economic considerations.

To make the use of the curve more clear, an explanation might be of further use. Opposite each load is plotted the per cent of time the unit has operated at this load, or at a greater load. Therefore, to obtain the time that the unit has been operating between two given loads the difference between the values of per cent of time opposite each of these loads would give the desired result. For instance, for the year 1927 the unit operated at, or above, a load of 50,000 kw. 88 per cent of the time. It operated at, or above, a load of 58,000 kw. one per cent of the time. The unit, therefore, operated 87 per cent of the time during the year 1927, between this load range of 8,000 kw., throughout which the efficiency is between 89 per cent and 91 per cent. By reference to Figure 3 it is evident that this range is located within limits of eight per cent on either side of the point of maximum economy for a flow of 20,000 c.f.s., which is the average resource available.

$2,000 Award for Industrial Advertising Campaign

THE Harvard Advertising Awards Committee of the National Industrial Advertisers' Association has announced the annual Bok Award of $2,000 for the best industrial advertising campaign for 1929 appearing in newspapers and periodicals.

Closing date of this competition is Dec. 31, 1929. Industrial advertisers will find that a consideration of the requirements alone will tend to inspire higher standards in industrial advertising.

The details of participation can be secured direct from Harvard Graduate School of Business Administration, Soldiers' Field Station, Boston, or from A. H. Oberndorfer, chairman N.I.A.A. awards committee, Sivyer Steel Casting Company, Milwaukee, Wis.

The Domestic Load and Some of Its Problems from the Utility Standpoint

By H. C. Rice

YOU will find the text for my address in the twenty-second chapter of Exodus—the twenty-first verse: "Thou shalt neither vex a stranger, nor oppress him." These words were spoken to the children of Israel after they had escaped from Egypt and were about to enter the promised land. At this time there was being formulated that elaborate code which ever since has been known as the Mosiac Law. Many centuries have elapsed since that time, yet most of the laws of Moses are still recognized as being sound and worthy of our observation. At the same time, many of these laws which no doubt were excellent and even necessary when written, have since become obsolete.

We, who by virtue of our technical knowledge, are sometimes consulted in the preparation of codes and ordinances should bear in mind this admonition, *Thou shalt neither vex a stranger, nor oppress him.* Laws such as the Electric Code are not necessary for the protection of the technically trained man. He knows what he can do with safety, and what should be avoided. The laws are designed by trained men for the protection and benefit of the uninitiated. They should not include unnecessary measures which will vex and oppress the citizen affected.

IN the forty years that have elapsed since 1890 the changes that have taken place in the electrical industry are more pronounced than the sociological changes that have transpired since the time of Moses. While we are smiling at an ancient law which prohibited the use of pork as a food, would it not be well to examine some of our electrical codes and ordinances to determine if they, too, do not contain features that are no longer essential? Should not our efforts be directed toward the simplification of existing codes, rather than adding new and oppressive features to them?

The electrical industry is a vast organism, composed of innumerable elements, each of which is dependent on some of the others for its existence and welfare. As the industry prospers, so will those engaged in it, progress. As the manufacturer produces better appliances at lower costs, the power company's market broadens and the consumer profits. As the power company's lines are extended, more and more customers are uncovered where the electrical contractor can be employed. Through it all runs the factor of public safety, meeting the manufacturer in the underwriter's laboratory and the Bureau of Standards, meeting the Power Company through the Railroad Commission and the Accident Commission, and meeting the contractor and the public largely through the various inspection bureaus. Each of these should work in cooperation with the others, but at the same time, remembering that their purpose is to serve, and not to oppress, mankind.

Mr. Rice is Manager of the Merchandise Department of the Southern California Edison Company, Los Angeles. This address was delivered before the California Electrical Inspectors Association, at San Francisco.

Those contractors who think that they can increase their volume of business by making electrical installations more difficult and expensive are nearsighted. The inevitable function of a funnel is to restrict the flow of whatever is trying to pass through it, whether it be water or money. By the observation of changes in female attire within the past fifteen years, we may well be convinced that human life can get along very well with what appears to be a minimum of protection.

Gasoline is fully as dangerous as electricity. What would have been the effect on the sale of automobiles if they had been surrounded and encumbered with protective devices similar to those sometimes demanded in connection with the installation of an electric range? Why should we insist on a factor of safety all out of proportion to the risk involved?

The fact that you have invited me, as a representative of the power companies in California, to speak at this meeting is evidence of your sincere desire to co-operate with other branches of the industry in a common effort to give the ultimate consumer a reliable and economical service. I also see in this invitation an implied request for the power companies' point of view, and with this assurance of your good will I shall make some rather frank statements knowing that you will accept them in the spirit in which they are offered.

In the ordinary course of events, the inspector comes in contact with the consumers only at the time the new building is being constructed, or when a remodeling job of sufficient scope to require an official permit is being done. On the other hand, the representative of the power company frequently visits the consumer's property and some of the things that develop from these visits are surprising. For example, a complaint of dim light, meaning low voltage, will lead to an investigation showing that the customer's meager wiring is seriously overloaded. Again, the troubleman will be called out by a customer who merely says, "My lights will not burn." He finds a fuse blown out, also by an overload.

THE customer may be convinced that a change in his electric wiring should be made, but he is reluctant to do this as he is afraid of the cost. May I now ask you this pointed question, "If we increase the cost of electric wiring by requiring excessive protective devices and expensive material, which in turn demand a high labor cost for their installation, is there not a possibility that the consumer, to escape this expense, will resort to schemes and devices which increase his electrical hazard? Is not the object of safety defeated, rather than aided, by a system which makes it difficult for the customer to use the desired appliances in a safe, sane and inexpensive manner?"

Some cities have raised their standard of wiring so high that the high price tends to keep down the adequate number of outlets, resulting in the hazardous condition of running cords under rugs and having the customer install his own outlets in an unsafe manner.

Those enterprises whose product or service competes with electricity will always be found heartily endorsing any proposal which will make electrical appliances more difficult to install or more expensive to use. May I again suggest that the function of your group is in the interest of the user. Through the payment of a fee, which comes from his pocketbood although actually paid by a contractor, the prospective user of electricity engages your expert service and advice. Although he may not definitely say so, his application for a permit implies that he wants to know what electrical equipment he should have at a minimum cost which will assure adequate, reliable and safe service. He would not be happy if he thought that some of your rules had been inspired by selfish outside interests in no way connected with his particular situation.

You have heard the story of the man who was being pressed for a debt of $300.00. He stalled along for several months and finally, being unable to give further excuses, he signed a note in favor of the creditor. Then he heaved a great sigh of relief as he said, "Thank Heaven, that's paid." It seems to me that, in much the same fashion, those who prepare electrical ordinances have been inspired by a similar theory. When a new condition develops to the point where it becomes acute, some group gets together and devises a new rule. Then they have it endorsed by the proper legislative body following which they say, "Thank Heaven, that's fixed."

Men who are closely in touch with public opinion, such as politicians and editors, know that nothing permanent can be accomplished where the public is involved until that public comprehends the problem and shows a desire to co-operate. From your long experience in meeting home builders, I am sure you realize that the public welcomes your service insofar as it represents a protective feature, but that they resent anything which may give them the impression that you are doing something which will increase the cost of their home without giving them any visible benefit. If the home builder does not have confidence in your department, he is going to try to avoid an inspection at some later date when he may be doing some remodeling and, to this extent, the main object of your existence has been defeated. At the same time, the reputation of the entire electrical industry has been somewhat tarnished. The consumer will soon be receiving a low voltage service for which he blames the power company, and also having a poor opinion of the manufacturer who produced the device which is not giving him good results.

THIS leads to the next point I want to emphasize. As I see it, there is only one time when you may feel positive that the electrical installation in a new home, apartment or store is completely under your control and that is when the new building is erected. After it is connected to the power company's lines, there are innumerable ways whereby the service can be extended without your official knowledge. If you agree with me, is it not the part of wisdom to urge the owner to anticipate his electrical requirements for several years to come and provide for them in the original installation? We know that such a course will be more economical for him and further that it will be subject to adequate supervision.

I am firmly convinced that the entire electrical industry would benefit and the consumer would be better served if the inspector working out of your offices might be trained to quiz the consumer along these lines at the time of his first contact with the job. What would happen if he would ask half a dozen questions? "Don't you think it would be a good idea to put lights in these closets? You know many fires are started by people hunting for things with matches."—"Don't you think you should have some more convenient outlets? Where are you going to connect your radio — vacuum cleaner — table lamps — toaster — percolator — heating pad—bedside lamp—sewing machine—your boy's electric train—your curling iron?"—"Why don't you provide the wiring for an electric range? You may not want one now, but the chances are you will within the next five years."—"Some day you are going to have an electric ironer. Why don't you provide an outlet for it at this time?"—"I think it would be a good scheme for you to provide a three wire No. 6 service. It won't cost much now and it will be a great help to you in the future."

I am not suggesting that you turn your inspectors into salesmen and I do not believe the customer would so consider you. But I do believe that we would have better wiring installations and that your department would have better control over them if something of this sort might be put into practice.

In a little city near Los Angeles, the inspection department has developed this idea to the point where they ask the prospective builder, "Why don't you make a 'Red Seal' installation and assure yourself the full benefits of electric service?" It is surprising how many welcome the idea and change their plans accordingly. Coming as it does from a party who has no commercial interest, this suggestion is always received as friendly advice.

Another feature which has been somewhat annoying to the power companies, is the lack of uniformity of electrical ordinances. One of my friends has this to say, "Electricity obeys the same laws, irrespective of municipal boundary lines and it certainly would be of great benefit if the ordinances were standardized, especially in California where the same utility serves hundreds of cities and towns." We hope that the good work already done by way of preparing a uniform ordinance will be continued, and I am sure I may speak for the entire group of power companies in the state in offering you the use of their records and the services of their men, if such will be of any assistance to you.

The constant tendency of manufacturers is to give greater value to the ultimate consumer, either directly by reducing the price or by furnishing an improved appliance without increasing the price. The Utilities also have consistently lowered the cost of electricity. However, when we come to the point of installing an electrical distribution system in the consumer's house or store, the tendency has been to increase the safety factor and with it the cost to the customer—in some isolated instances, these increased costs amounting to several hundred per cent.

The power companies of California supply approximately 1,000,000 residences. My own company takes care of 350,000 of this number. Three years ago the average annual consumption per meter was 365 kilowatt-hours or one kilowatt-hour daily. On August 1 of this year, this average annual consumption had reached 614 kilowatt-hours. The figures I am using are averages for the entire system. Naturally this means that some districts are higher and others are lower than the indicated figures.

To me, it is highly significant that the districts reporting the lowest figures are the ones where wiring requirements are most rigid. I can cite you an instance where four switches are demanded between the company's pole and an electric range. That house has electrical protection all out of proportion to the hazards of bacteria and bacilli that assail its kitchen from every approach. And if, by chance, one of the numerous fuses should blow, a real hazard is faced by the person who attempts to locate it.

Behind the Veil

Electricity and Communications: Part I. The Electric Telegraph

By ERNEST GREENWOOD

The ninth of a series of articles portraying against a social-historic background the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

WHEN we speak of "Communications" today we instantly think of the United States Mail Service, the telephone, the telegraph, the radio, wireless, airplanes and what-not. Narrowing the phrase down to "rapid communication," our thoughts turn to Samuel Morse as though he were the first to think of the idea and as though he were the inventor of practically instant communication between points separated by great distances. Very few of us realize that the idea of "rapid communication" and the search for means by which it might be accomplished is almost as old as civilization itself—that it dates back to a time when the only manifestation of electricity known to man was lightning and when even the magnetic properties of the lodestone were unknown.

Yet, if we are to believe Aeschylus, the father of Athenian drama, Agamemnon, in 1084, B.C., employed a line of optical signals to advise his queen, Clytemnestra, of the fall of Troy. Robert Browning's translation, London, 1877, runs as follows:

> "Troia, the Achioi hold . . .
> Hephaistos — sending a bright blaze from Ide
> Beacon did beacon send, from fire the poster,
> Hitherward: Ide to the rock Hermaian
> Of Lemnos: and a third great torch o' the island
> Zeus' seat received in turn, the Athoan summit.
> And—so upsoaring as to stride sea over,
> The strong lamp-voyager, and all for joyance—
> Did the gold glorious splendor, any sun like,
> Pass on. . . ."

Ann Swanwick gives us another version of Aeschylus' "Agamemnon" as follows:

> "For Priam's city have the Ariges Won.
>
> . . . .
>
> Hephaistos sending forth Idaian fire.
> Hither through swift relays of courier flame . . ."

Mottelay tells us that on page 193 of his "Agamemnon," E. H. Plumtre refers to the system of posts, or messengers, which the Persian kings seem to have been the first to organize, and which impressed the minds of both the Hebrews and the Greeks by their regular transmission of the king's edicts, or of special news. It is also interesting to note that Homer, the great epic poet, relates that the lodestone was used by the Greeks to direct navigation at the time of the siege of Troy.

So much for Agamemnon.

It seems to have remained for that celebrated patriarch, Job, whose chief asset, patience, would find but little market in America to day, to go down in history as the first to suggest the electric telegraph. We find him saying in Job XXXVIII, 35: "canst thou send lightnings, that they may go and say unto thee, 'here we are'? (Behold us)."

SAMUEL F. B. MORSE

(A later portrait than the one used on the cover)

Moffet, in his new translation of the Bible, gives a version that is even more explicit:

> "Can you send out the lightning on its mission?
> Does it say humbly to you,
> Here am I?"

There is also a story in "Pre-Adamite Man," in which the author, P. B. Randolph, quotes an instance, seemingly uncertain as to whether it comes from Mcrinus or some other writer. He found good evidence, he says, during his stay in Egypt, that one of the Cleopatras actually sent news by a wire to all the cities from Heliopolis to the Island of Elaphantine.

The earliest *reliable* record of messages transmitted by the *sign of fire* is to be found in the book of Jeremiah, the date of which is placed by Mottelay as 588, B. C.:—"O ye children of Benjamin, gather yourselves to flee out of the midst of Jerusalem, and blow the trumpet in Tekoah, and set up a sign of fire in Beth-haccerem; for evil appeareth out of the North, and great destruction." Again we find that Moffet's new translation of the Bible is more explicit, for it puts it in this way:

> "Fly for safety, men of Benjamin,
> fly from Jerusalem
> blow the trumpet in Tekoah,
> light a beacon on Beth-hakkherem;
> for trouble is looming out the North,
> ay, fell disaster."

Coming back once more to the earliest references to "communication by wire," we must jump forward two or more thousand years to 1667, when Dr. Robert Hooke, who became secretary of the Royal Society, alludes to the possibility of telephony. He says: "And as glasses have highly promoted our seeing, so it is not improbable that there may be found many mechanical inventions to improve our other senses—of hearing, smelling, tasting, touching . . . 'tis not impossible to hear a whisper a furlong's distance, it having been already done; and perhaps the nature of the thing would not make it more impossible though the furlong be ten times multiplied. And though some famous authors have affirmed it impossible to hear through the thinnest plates of Muscovy glass, I know a way by which it is easy to hear one speak through a wall a yard thick. It has not been examined how far acoustics may be improved, nor what other ways there may be of quickening our hearing, or conveying sound through other bodies than air, for that is not the only medium. I can assure the reader that I have, by the help of a distended wire, propagated the sound to a very considerable distance in an instant, with seemingly as quick a motion as that of light, at least, incomparably swifter than that which at the same time was propagated through the air; and this not only in a straight line, or direct, but one bended in many angles."

Considering the fact that this statement was made at least 180 years before Alexander Graham Bell was born, it must, at least, be considered as remarkable. Science was to wait one hundred and twenty-nine years for the invention of the Voltaic Pile by Allesandro Volta. We can only classify Hooke's comments with Da Vinci's belief in the possibility of flying machines, or Roger Bacon's prediction of chariots which would move with incredible speed under their own power. What Hooke may have been dreaming of, what he had seen, what experiments he had made which persuaded him to make such a statement, probably no one knows. Nevertheless, it can be accepted as the first suggestion of the telephone, even though had the telephone of the present day been suggested to him he probably would have ridiculed it.

But Hooke seems to have abandoned this idea of instant communication "through a wall a yard thick" and the possibility of hearing "a whisper a furlong's distance," for we find him, ten years later, setting forth a plan of "telegraphic transmission" in a paper addressed to the Royal Society, which is nothing more or less than a system of signaling by semaphores. In this paper he shows a way "how to communicate one's mind at great distances . . . 40, 100, 120, etc., miles . . . in as short a time, almost, as a man could write what he would have sent." His apparatus consisted of an elevated framework supporting an open screen, behind which were suspended as many wooden devices, or symbols, such as circles, squares, triangles, etc., as there were letters in the alphabet. In the day time, these devices were drawn up by a rope behind the screen and made visible in the open space, while during the night use was made of torches, lanterns, or other lights.

Again we must jump a hundred years to 1773 in our search for references to electrical communication, when we find, as mentioned in a previous chapter, a Swiss physician, one Louis Odier, writing to a lady friend upon the subject. For the sake of emphasis and to keep our thoughts fixed on the chronology of the birth of rapid communication by means of electricity the text of this letter is repeated:

"I shall amuse you, perhaps, in telling you that I have in my head certain experiments, by which to enter into conversation with the Emperor of Mogol or of China, the English, the French, or of any other people of Europe, in a way that, without inconveniencing yourself, you may intercommunicate all that you wish, at a distance of four or five thousand leagues in less than half an hour! Will that suffice you for glory? There is nothing more real. Whatever be the course of those experiments, they must necessarily lead to some grand discovery; but I have not the courage to undertake them this winter. What gave me the idea was a word which I heard spoken casually the other day, at Sir John Pringle's table, where I had the pleasure of dining with Franklin, Priestly, and other great geniuses."

WHAT was the word spoken at Sir John Pringle's table which gave this Swiss doctor the idea that almost instant communication could be had over ten or fifteen thousand miles? Both Franklin and Priestly were outstanding experimenters in the field of electricity. Did they discuss the possibilities of the telephone and the telegraph? Did they foresee the time when a man could sit in his home or his office in America and talk to London, or any of the great cities of Europe, almost as easily as he might talk to some acquaintance in the next block? Did they foresee the great overland telegraph lines and the overseas cables? Perhaps they did. At least, there must have been something that would bring about a discussion which gave Dr. Odier the ideas he transmitted, by letter, to his lady friend.

In 1769, Volta made known his invention of the electrophorus, a sort of perpetual reservoir of electricity, and on March 20, 1800, announced the Voltaic Pile, although this discovery had been made in 1796. But as early as 1777 he seems to have entertained some idea of an electric telegraph—as noted in a previous chapter—although nothing more appears to be on record in relation to the matter. Sir Francis Ronalds speaks of an autographed manuscript dated April 15th, 1777, in which Volta states that he does not doubt the possibility of exploding his "electrical pistol" at Milan, through wires supported by posts, whenever he discharges a powerful Leyden jar at Como.

In 1792, Claude Chappe, a French mechanician, introduced the semaphore which he at first called a *tachygraphe*, from two Greek words meaning to write fast, but to which M. Miot, chief of one of the divisions of the War Department, gave the name of "telegraph" during the year 1793. This semaphore consisted of a vertical wooden pillar 15 or 16 feet high, bearing a transverse beam 11 or 12 feet long, which turned upon its center and held at each extremity pivoted arms so worked by cords or levers as to admit of 256 distinct signals. The semaphores were placed upon high towers, about four miles apart on level ground, and even as much as ten miles apart upon intervening elevations.

This system of signals was presented by Chappe to the legislature and was originally erected during the month of August, 1794, upon stations between Paris and Lille (Lisle), a distance of about 148 miles. One of the first sentences conveyed between the two places by the Committee of Public Safety consumed 13 minutes and 40 seconds, but it was not long before dispatches could be conveyed in 2 minutes, and it was through Chappe's apparatus that the news of the recapture of the city of Condé was conveyed to the Assembly shortly after the entry of the troops of the Republic.

It was not until 1809 that Samuel Thomas von Sommering, a German anatomist and physiologist, first employed voltaic, or contact, electricity for the transmission of telegraphic signals. Between 1794 and 1809 many improvements were made on the Chappe Semaphore. There was the tellograph (a contraction of the word telelograph) of Edgeworth in 1794, the six shutter telegraph of Lord George Murry in 1795, the telegraphs of the Reverend J. Gamble, a chaplain to the Duke of York, in 1795, and the system proposed by John Garnet during the same year. In 1802, George Frederick Parrot, a Russian physician and professor at Dorpat, who of all the European scientists of these times is the one who developed most extensively the chemical theory of the voltaic pile, also devised a semaphore system of telegraphing, as did Mr. Joseph Davis, in 1805, whose system was simply an improvement on that of Lord George Murry. In 1808, General Charles William Pasley describes "the original and improved methods of construction of his polygrammatic telegraph," which he abandoned in 1823 for his "Universal Telegraph for Day and Night Signals," which, again, was a semaphore system.

The electric telegraph of von Sommering, which was constructed between July 9th and August 6th, 1809, is described by Fahie, in his "History of Electric Telegraphy," as consisting of thirty-five gold rods placed into glass tubes, starting from a reservoir of acidulated water and connecting with thirty-five silk covered wires, which were run into thirty-five apertures of copper (corresponding with twenty-five letters and ten figures) upon a wooden stand, into each opening of which the wires of the voltaic pile could be inserted. When the latter were connected, the bubbles rising through the decomposition of the water were made to enter the lettered glass receivers through which the messages could be deciphered. On August 8th, 1809, he was able to transmit intelligence a distance of 1000 feet, and twenty days later he presented his apparatus to the Bavarian Academy of Sciences.

According to the Journal of the Franklin Institute for 1859 (Vol. XXXVIII, p. 398) von Sommering's telegraph was carried by Dominique Jean Larrey, chief surgeon of the French armies, to Paris, where it was delivered by him to the French Academy of Sciences on December 5th, 1809, and a committee was appointed to report on the new invention. In 1810 and 1811, von Sommering reduced the number of wires in his apparatus to twenty-seven. These brass or copper wires were first insulated with a covering of gum lac and then a silk thread, after which they were united into a thread covered cable 1000 feet in length. The cable was in turn covered with heated gum lac, or with a ribbon plunged in a solution of the same substance. The Russian Count Jeroslas Potocki took the new instrument to Vienna and submitted it on July 1st, 1811, to the Emperior Francis I., while another model of the apparatus was sent to William von Sommering, then at Geneva, where it was shown to De la Rive, Augustus Pictet and other scientists. During March, 1812, this instrument transmitted messages 10,000 feet, or ten times the distance previously reached.

Reizen in 1794, Salva in 1798, and Ronalds in 1816, all proposed a system of visual telegraphy by interrupting electric circuits, causing an electric spark to appear at the point of disconnection of each wire, as desired. In 1831, Henry constructed and successfully operated an electro magnetic signaling apparatus, which consisted of a magnetized steel bar, ten inches in length, which was supported on a pivot in a horizontal position with its north end between the two arms of a horseshoe magnet. When the latter was energized by the current, and the end of the bar was attracted by one arm of the horseshoe and repelled by the other, it caused the further extremity to strike a suitably adjusted bell, and a code was arranged by varying sound combinations.[1]

The action of the electric current on a magnet was first applied to electric telegraphy by Ampere in 1820, at the suggestion of La Place who believed that the deflections of small magnets placed at the receiving ends of 26 wires could be used to indicate the letters of alphabet. Ampere's apparatus was the pioneer of a number of needle instruments which came into extensive use between the years 1829 and 1841.[2]

Samuel Finley Breese Morse, who is rightly accredited with being the inventor of the first practical recording electric telegraph, was born at the foot of Breed's Hill, in Charlestown, Massachusetts, April 27, 1791. This was the year before Chappe introduced his semaphore tachygraphe, and two years before the coining of the word "telegraph," but, curiously enough, the same year in which Michael Faraday was born. But, unlike Faraday, who had no education to speak of except that which he gleaned from the books that came into his employer's shop to be bound, or Edison, whose early education came almost entirely from his mother, Morse had every educational advantage available at the time.

HIS father was Jedediah Morse, D.D., who came of a long line of highly cultured and educated forebears. Dr. John Todd has said of him: "Dr. Morse lived before his time, and was in advance of his generation." According to S. L. Prime (Life of S. F. B. Morse, D. Appleton & Co., 1875), he was "a projector, author, founder, inventor. His works were in the line of intellectual and moral progress, but to him the world owes large and lasting gratitude, as well as to his illustrious son. In early years he exhibited a fondness for books; and a delicacy of constitution unfitting him for the severe labors of the farm, his ardent desire for education was gratified by his judicious and intelligent father. In the spring of 1779, in the midst of the War of American Independence, he was admitted into Yale College . . . . He studied theology under the Reverend Dr. Jonathan Edwards, son of President Edwards, and Professor Samuel Wales. Before he was licensed to preach, and while teaching school in New Haven, he projected and began his 'American Geography' which afterward was inseparably identified with his name."

"He was a man of genius," says Prime, "not content with what had been and was; but originating, and with vast executive ability combining, the elements to produce results. To him, more than any other one man, may be attributed the impulses given in his day to religion and learning in the United States. A polished gentleman in his manners; the companion, correspondent, and friend of the most eminent men in Church and State; honored at the early age of thirty-four with the Degree of Doctor of Divinity by the University of Edinburgh, Scotland, sought by scholars and statesmen from abroad as one of the foremost men of his country and time, such a man was the father of the inventor of the Telegraph."

But Finley Morse, as he is often spoken of in early histories, did not have to depend entirely on heritage. At the age of four, he was placed in a small private school conducted by an invalid woman known locally as "Old Ma'am Rand." When seven years old he was sent to the preparatory school of Mr. Foster, at Andover, where he was fitted for entering Phillips Academy, there to spend several years preparing for Yale. Like Edison and Faraday he seems to have lived largely in a world of books, one of his favorites being Plutarch's "Lives of Illustrious Men." At the age of fourteen he was thoroughly qualified to enter Yale, but his father held him back and he entered in the class of 1807 at the age of sixteen.

At this time, Jeremiah Day was Professor of Natural Philosophy at Yale, and under his instructions Morse began the study of electricity. Forty years after Morse had left the institution, Mr. Day wrote this note:

"In my lectures on Natural philosophy, the subject of electricity was especially illustrated and experimented upon. Enfield's work was the text book.

"The terms of the 21st proposition of Book V of 'Enfield's Philosophy' are these:—'If the circuit be interrupted, the fluid will become visible, and when it passes it will leave an impression upon any intermediate body.'

"I lectured upon and illustrated the first two experiments propounded by the 21st proposition, and I recollect the fact with certainty, by memoranda now in my possession. The experiments referred to are in terms as follows:

" 'Experiment 1st:—Let the fluid pass through a chain, or through any metallic bodies, placed at small distances from each other, the fluid in a dark room will be visible between the links of the chain, or between the metallic bodies.'

" 'Experiment 2nd:—If the circuit be interrupted by several folds of paper, a perforation will be made through it, and each of the leaves will be protruded by the stroke from the middle to the outward leaves.' "

"This," says Prime, "was the germ of the great invention that now daily and hourly astonishes the world (Prime was writing in 1875), and has given immortality of fame to the student, who, twenty-two years afterward, conceived the idea of making this experiment of practical value to mankind." Morse himself said, in 1867:—"The fact that the presence of electricity can be made visible in any desired part of the circuit was the crude seed which took root in my mind, and grew up into form, and ripened into the invention of the Telegraph."

---

[1] See Encyclopedia Britannica.

[2] See Encyclopedia Britannica.

But it was Professor Benjamin Silliman to whom, more than anyone else, Morse was indebted for those impressions which finally resulted in the invention of the first practical telegraph system. Professor Silliman gave a course of lectures on chemistry and galvanic electricity. The batteries then in use were the Voltaic Pile, the battery of Cruickshanks, and the *Couronne des tasses* (the crown of cups mentioned in a previous chapter). Silliman always exhibited these batteries to his classes, taking them apart and putting them together again. Morse was one of his pupils. Furthermore, ten years after his graduation, Morse often went to Silliman's laboratory and watched his experiments.

Originally Morse had no intention of being a business man or a scientist; his one ambition was to become an artist. His father was a man of large views, and, while he had given his son a liberal education, he yielded to the son's desires to turn away from the learned professions and become a painter. Eventually he turned him over to Washington Allston, who had returned from Europe in 1809 and who was then the greatest artist in this country, Allston took Morse to Europe in 1811, and, even though he was determined to become a painter, his first letter home expresses a longing that was almost prophetic, when he wrote:

"I only wish you had this letter now to relieve your minds from anxiety, for while I am writing I can imagine mother wishing that she could hear of my arrival, and thinking of thousands of accidents which may have befallen me. *I wish that in an instant I could communicate the information: but three thousand miles are not passed over in an instant, and we must wait for long weeks before we can hear from each other."* On the outside of this letter, written in his own hand with pencil, but at what date is not known, are these words: "Longing for a telegraph even in this letter."

Soon after he arrived in London, Allston took Morse to call upon Benjamin West, one of the greatest artists of his time. Although an American, he was at the head of the Royal Academy of England and was a great favorite of the King. West always remained true to his native country, yet he always retained the confidence of the King and was actually at work on a portrait of him when he was given the Declaration of Independence. Mr. Morse relates an interesting incident in connection with this occasion, which was told to him by West himself. Turning to the picture of the King, West said:

"Do you see that picture, Mr. Morse?"

"Yes, sir," I said; "I perceive it is the portrait of the King."

"Well," said Mr. West, "the King was sitting for me for that portrait when the box containing the American Declaration of Independence was handed to him."

"Indeed," I answered, "and what appeared to be the emotions of the King? What did he say?"

"Well, sir," said Mr. West, "he made a reply characteristic of the goodness of his heart," or words to that effect. " 'Well, if they can be happier under the government they have chosen, than under mine, I shall be happy.' "

MORSE achieved considerable success as a portrait painter in England, receiving and executing a number of commissions. On Aug. 21, 1815, he started for America and it is interesting to note that he had to wait fourteen days in Liverpool "for a fair wind." He arrived in Boston on Oct. 18, after a passage of 58 days and an absence from his country of more than four years. He opened a studio in Boston, but when an entire year dragged by without his receiving a single order, he went to New York where he spent the years from 1826 to 1829 both as a teacher and a pupil. In 1827 he again renewed his interest in electricity and particularly in electro-magnetism, becoming intimately associated with James Freeman Dana who was giving a course of lectures on the subject before the New York Athenaeum. The year following he became eminently successful as a painter, his sitters becoming so numerous that he was unable to meet and fill all of his orders. Finally, while still President of the National Academy and among the first of his profession in the United States, he resolved to go abroad again. Leaving his children in the care of relatives (his wife had died) he sailed from New York, Nov. 8, 1829.

To follow his career in Europe during the next three years would require more space than can be alloted in this chapter. As a painter his success continued and many persons of historical importance, among them General Lafayette, became his friends. Among his artist friends was R. W. Habersham, of Augusta, Georgia, who claims to have had a conversation with him in Paris in which he first suggested the telegraph. This was confirmed by J. Fenimore Cooper, the author, although Morse himself could not recall the conversations to mind. His own recollection of his first conception of the telegraph dates from October, 1832, on board the ship Sully, while he was returning to America. In the early part of the voyage conversation at the dinner table turned to recent discoveries in electro-magnetism and particularly to experiments by Ampere and Franklin. At one point in the discussion Morse said: "If the presence of electricity can be made visible in any part of the circuit, I see no reason why intelligence may not be transmitted instantaneously by electricity." From that time on he seems to have thought of little else.

The identity of lightning and electricity had been known for a long time. Signals had been made at a distance by electricity and intelligence transmitted, just as beacon fires had, from time immemorial, flashed the knowledge of events across continents. But this was not the idea back in the brain of Morse. What he was thinking about was the transmission of intelligence and the *recording* of it at a distance. To him nothing else was a telegraph. It must be an instrument which could *write* at a distance. "If it will go ten miles without stopping," he said, "I can make it go around the globe." He explained his ideas to Captain Pell of the Sully, and just before the vessel arrived in port he said to him: "Well, captain, should you hear of the telegraph, one of these days, as the wonder of the world, remember the discovery was made on the good ship Sully." Captain Pell stated under oath, that when he saw the instrument Sept. 27, 1837, he recognized in it the same mechanical principles and arrangements which he had Mr. Morse explain on board of the Sully in 1832.

Hardly had he arrived on American soil before Morse began to construct an instrument which would test the practicability of his idea. From this hour on there began a struggle which was to last for twelve long years. His mind was absorbed with the idea of a recording telegraph, while at the same time he was wholly dependent upon his profession as an artist. He had three small children and no money. He had long received assistance from his father and brothers but it seemed to him like stealing to take this money for his experiments—it was the old story of genius contending with poverty.

"Up to the autumn of 1837," he says, "my telegraphic apparatus existed in so rude a form that I felt a reluctance to have it seen. My means were very limited—so limited as to preclude the possibility of constructing an apparatus of such mechanical finish as to warrant my success in venturing upon its public exhibition. I had no wish to expose to ridicule the representative of so many years of laborious thought. Prior to the summer of 1837, at which time Mr. Alfred Vail's attention became attracted to my telegraph, I depended upon my pencil for subsistence. Indeed, so straightened were my circumstances that, in order to save time to carry out my invention and to economize my scanty means, I had for many months lodged and eaten in my studio, procuring my food in small quantities from some grocery, and preparing it myself. To conceal from my friends the stinted manner in which I lived, I was in the habit of bringing my food to my room in the evenings, and this was my mode of life for many years."

When Morse finally had his recording telegraph instrument ready to submit to the public, he decided he would show it first to a "few intelligent and appreciative friends in New York." Among those were General Thomas S. Cummings, who had recently been promoted to a military command, and in allusion to that fact one of his friends wrote the first message ever recorded by the Telegraph. It was: "Attention, the Universe. By Kingdoms, Right Wheel."—A Fac-simile of the original strip on which this was recorded will be found on page 332 of Prime's "Life of S. F. B. Morse."

On February 21st, 1838, Morse demonstrated his telegraph before the President of the United States and his cabinet and a bill was subsequently passed appropriating $30,000 to be expended on a series of experiments to test its practicability. According to the Encyclopedia Britannica, Morse applied for his first patent on April 7th, 1838, and it was granted on October 24th, 1848. This is probably a typographical error and should read "1838," but the facts seem to be (according to Prime and well supported by correspondence) that his first patent was granted in the year 1840. The bill appropriating the $30,000 to test its practicability was not passed until February 23rd, 1843, and then only by the close vote of 89 to 83. When the vote was finally recorded, however, it was found to stand yeas 90, nays 82,—a majority of 8. Professor Morse himself made a careful analysis of this vote in the House of Representatives and it is worth noting.

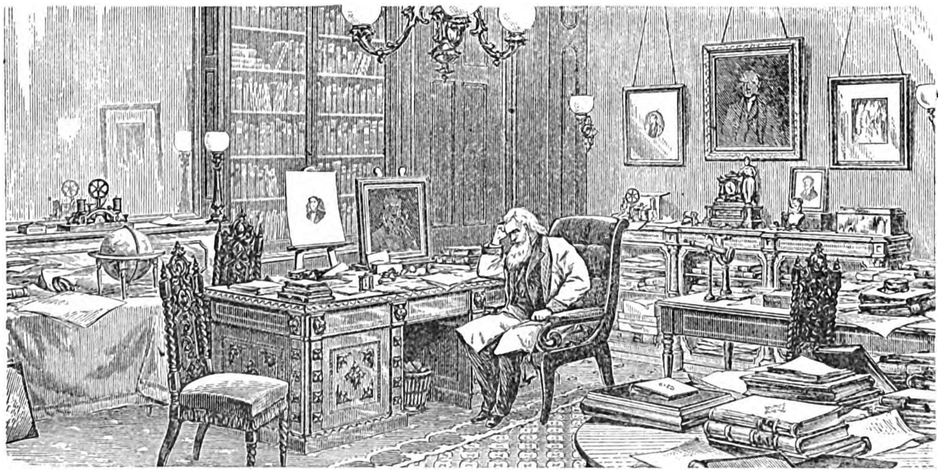
GROUPING the states of Maryland, Virginia, North and South Carolina, Georgia, Kentucky, Tennessee, Louisiana, Mississippi and Alabama, 47 representatives voted against the appropriation, 14 voted for it and 31, according to Morse's own record, were "neutral." The New England States voted as follows: 17 ayes, 9 noes, and 8 neutral. Grouping the states of New York, Pennsylvania, New Jersey, Delaware, Ohio, Indiana and Illinois, the vote stood: ayes 58, noes 25, and 22 neutral. It would seem that the North was strongly in favor of the appropriation, while the South opposed it.

The work of constructing a line from Washington to Baltimore was started almost immediately. The first plan was to enclose the wires in tubes laid in the earth. Ezra Cornell, founder of Cornell University, had invented a machine to lay pipe and he was employed to take charge of the works under the superintendence of Mr. Morse. When two thirds of the appropriation was expended it was estimated that it would take another $30,000 before the work could be completed. Morse then recommended that the tubes be abandoned and the wires placed on poles. This was adopted and within a short time the forty-mile pole line was built.

On the 24th day of May, 1844, after some private practice and experiments over the line, Morse was ready for his great public demonstration. He had invited his friends to assemble in the chamber of the U. S. Supreme Court, where he had this instrument, from which wires extended to Baltimore. He had promised a young friend, a Miss Ellsworth, that she should send the first message. Her mother suggested the words of Scripture (Numbers XXIII 23) "What hath God wrought!" The whole verse reads; "Surely there is no enchantment against Jacob, neither is there any divination against Israel: according to this time it shall be said of Jacob and of Israel, What hath God wrought!"

Taking his seat at the instrument, Morse slowly sent the selected words. The message was instantly received by his assistant, Mr. Vail, in Baltimore, who was ignorant of the message to be sent and who returned it immediately to Washington. "Within a single moment of time," says Prime, "those inspired and inspiring words were carried back and forth through a circuit of eight miles." Failing to sell the telegraph to the government for $100,000, Morse enlisted private capital and in the same year a company was organized to erect a telegraph system between New York, Baltimore and Washington. By 1851, fifty companies using Morse telegraph patents were in operation in the United States and by 1861, Morse patents were in operation in several countries of Europe.

The story of the electric telegraph from this time on has been touched upon in other chapters and is too well known to require further comment here. The next chapter in the story of electricity and communications is the development of the telephone.



Professor Morse in his Study.

A Novel Campaign for the Presidency of a N. E. L. A. Company Section

THE Duquesne Light Company of Pittsburgh, Pa., elects the officers of the N. E. L. A. Company Section by popular vote. The candidates, particularly those running for president, put on a regular political campaign, and quite a lot of interest is usually worked up in the company over this election. Usually a campaign manager with a committee is appointed by the candidate, and this committee functions in the usual political way, assisted by the candidate in personal visits throughout the system, meeting the various employees and making the usual stump speeches.

Experience in the past demonstrated that it is exceedingly difficult for a candidate from a general office or so-called staff department, usually rather small, to win the election over a candidate from the very much larger operating department. The controlling vote is carried by the large field forces.

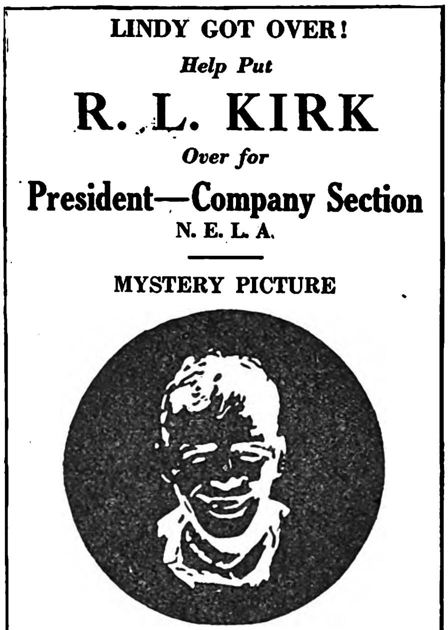
R. L. Kirk, assistant to the manager of the relatively newly created System Development Department, was therefore handicapped when he was nominated to run against one of the most popular and well liked men in the operating department. This was particularly noticeable when the nominations were announced at the usual meeting when a tremendous ovation was given the operating candidate and the announcement of the System Development Department candidate was practically unnoticed. With this background it is rather interesting to note the method employed by the staff department man to win the election, even though by a small majority, over the better known operating man.

The first step, devised by a board of strategy consisting of a small group of Mr. Kirk's supporters, was to prepare a poster for the bulletin boards throughout the system, designed to create interest in advance of the campaign. This poster consisted of a cartoon of a flying airplane with a miniature figure of Kirk waving from the cockpit. The wings of the plane bore the slogan "Kirk for President," and beneath appeared the words "Let Kirk be your pilot for 1930." To the right of the poster and in heavy type was the catch phrase, "Ask for your Mystery Card," and below this appeared the campaign slogan, "Something Different."

The preparation of a Mystery Card and Mystery Packages was begun, and carried on with great activity and much secrecy. A Collection Committee was organized, consisting of Messrs. Johnson, Carroll, Oldenburg, Stearns, Domer, and Gauss. Messrs. Egger and Boyer assisted the above committee in filling the Mystery bags.

This committee immediately got in touch with various manufacturers and distributors throughout the city and began collecting a large quantity of souvenirs, all of which had real tangible value, but were of a purely advertising nature. The manufacturers were advised that Mr. Kirk was running for president of the Duquesne Light Company Section of the organization, and wanted to conduct a novelty mystery campaign, and would come in contact with about two or three thousand employees who, as a class, represented typical Pittsburgh people. Inasmuch as considerable interest has always been shown in these campaigns, it would be an excellent means for advertising various articles by contributing to a Mystery Package which would be delivered to each individual to be taken to their homes. The response to this invitation was tremendous, as some fifty-five companies contributed approximately 25,000 items (not counting thousands of book matches).

In the meantime a novel campaign card was prepared by the candidate introducing something new in the form of an optical illusion. On one side of the card was the mystery picture, reproduced on this page, with the slogan, "Lindy got over—Help put Kirk over for President," on the top of the card. On the other side was the candidate's picture together with his campaign platform and the slogan, "Something Different," showing in several places.



LINDY GOT OVER!

Help Put

R. L. KIRK

Over for

President—Company Section

N. E. L. A.

MYSTERY PICTURE

"LINDY"

INSTRUCTIONS—Take card in both hands and look steadily at small diamond shaped speck on nose. Try not to blink, and count slowly to 40. Then look steadily up into sky or at a lighted wall for at least 10 seconds.

RESULT—The actual enlarged photograph will appear and disappear many times.

"Something Different"

This card, when distributed, created quite a sensation throughout the system.

On the Monday morning of the week of distribution, the candidate, with an assistant and a car bearing large posters on all windows "Kirk for President" and loaded to its capacity with Mystery Packages, set out to trail the paymaster to the various power plants and outlying districts. As the employees passed the paymaster they met the candidate, were given a Mystery Card and a Mystery Package, and their attention called to the fact that the campaign slogan "Something Different" would be carried out during the administrative year in the affairs of the Association if the candidate was successful in the election. It is needless to say that such a move was received with interest by the average employee; in fact, so much enthusiasm was shown in many cases that the candidate was nearly stampeded by the crowds seeking their packages before the supply was exhausted.

Requests for Mystery Cards were so numerous, not only from company employees, but from people all over the city of Pittsburgh, and indeed as far east as Harrisburg and Philadelphia, that a member of the campiagn committee was kept almost continuously busy mailing out cards to meet the demand. In fact, 2000 extra cards were printed at the last moment in order to have sufficient to go around, making a total of 6000 given out.

The committee wishes to emphasize the fact that the entire cost of the campaign to the candidate was only the cost of the usual campaign cards, as all the other items were cheerfully donated as advertising matter.

It is interesting to note that so unusual was it for a staff department man to win over an operating department man that even a few minutes before the announcement regarding the election was made at the last meeting there were quite a few bets placed at considerable odds in favor of the operating man. All of which goes to prove that it pays to advertise.

CORRESPONDENCE

The Electric Water Heater

High Wattage vs. Low Wattage Types

To The Editor:

In the October issue of the N. E. L. A. Bulletin there appeared the James H. McGraw Paper "The Electric Water Heater" by H. Geo. D. Nutting. In this paper the old controversy relative to the merits and demerits of the high wattage small storage and low wattage large storage types of electric water heaters is revived. Probably the most fundamental point with respect to the electric water heater is that the user be satisfied. It is generally agreed that in order to give satisfactory service the heater must possess the following characteristics:

1. The load characteristics and demand must be such that the utility can supply electric current at a cost comparable with other fuels.
2. The heater must have reasonably rapid recuperation.
3. The storage capacity must be sufficient to care for the greatest single draw of water desired.
4. The cost of the heater plus the cost of installation must be within the limits that the customer is willing to pay.
5. The installation should be simple and reliable (free from control devices which restrict the supply of hot water or which may fail in service).

Mr. Nutting has very ably pointed out the extent to which both high and low wattage heaters conform to some of these requirements, but there are others on which it appears that additional information is desirable for clarification and accuracy.

ITEM 1

One of the principal advantages of the low wattage heater is that it gives a large proportion of night time load. This is particularly the case where more than one heating element is used, since the upper element will cut off when the heater is partly full of hot water, leaving the lower element to complete the heating. Due to the necessarily rapid recuperation of a small capacity tank equipped with a high wattage heating element the recuperation is accomplished within an hour from the time of drawing water. This eliminates the possibility of night time load.

The accompanying chart shows the comparative loads obtained from various types of water heaters. This chart is based on the following:

Cold water supply, 50 deg. Fahr.

Heated water temperature, 150 deg. Fahr.

Average daily use of hot water per family, 50 gallons.

Average consumption of hot water as follows:

Morning (7.30 to 10.30 a. m.), 30 per cent equals 15 gallons.

Noon (12 to 1 p. m.), 10 per cent equals 5 gallons.

Early evening (5 to 7 p. m.), 15 per cent equals 7½ gallons.

Evening (8 to 10 p. m.), 45 per cent equals 22½ gallons.

100 per cent equals 50 gallons.

In order to distribute these quantities of water uniformly over the periods in which they are used, the draw-offs are distributed as follows:

3¾ gallons drawn at 7.30, 8.30, 9.30 and 10.30 a. m.

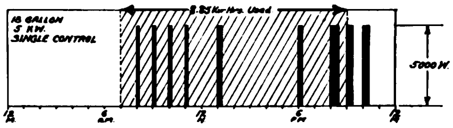
2½ gallons drawn at 12 noon and 1 p. m.

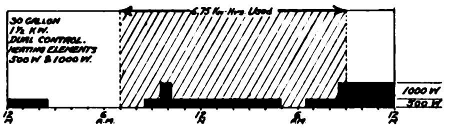
2½ gallons drawn at 5, 6 and 7 p. m.

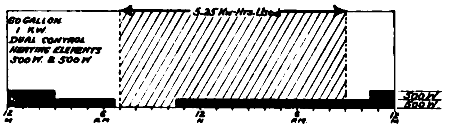
7½ gallons drawn at 8, 9 and 10 p. m.

The shaded portion of the chart from 7 a. m. to 9 p. m. represents the average period of maximum central station demand (or on-peak period). The black blocks represent the intensity and duration of the heater load. By adding up this load we find that the electrical energy used during the on-peak period is as follows:

18 gallon 5 kw. Single Control 8.85 kw-hr.
30 gallon 1½ kw. Dual Control 6.75 kw-hr.
60 gallon 1 kw. Dual Control 5.25 kw-hr.







In addition to the large amount of night time use, the low wattage heater does not require a large increase in the capacity of the service transformers or heavier wiring from the transformer to the house.

ITEM 2

In the high wattage, small capacity type of water heater there is no advantage in dividing the heating element into two or more circuits since a draw-off of 10 gallons of hot water will bring all the stages of heat on practically simultaneously. With the low wattage, large capacity heater the use of more than one heating element is a decided advantage, since draws of 10 gallons of water will not cause the upper element to be cut on and the recuperation will be accomplished by means of the lower element only. In case a large enough draw has been made to cause both elements to cut on the upper one will cut off when the tank is partly heated, leaving the lower element to finish the heating. This gives a prolonged load and is largely responsible for the large proportion of night time load obtainable with a low wattage heater. Naturally, a heater consuming a large proportion of night time load merits a lower rate on account of the smaller share of fixed charges chargeable against it.

ITEM 3

The use of high wattage heaters frequently requires the installation of a double throw switch between the range and the water heater in order to prevent excessive loading of the service transformer, etc., and the use of such a switch often prevents rapid recuperation of a small capacity tank at times when rapid recuperation is most necessary. One of the principal objections to the small tank is that the hot water supply will fail sooner when large draws of hot water are required and if immediate recuperation is not possible the customer will be without hot water. Large storage capacity (30 to 60 gallon) eliminates this necessity of rapid recuperation and provides an ample reserve of hot water to draw on. Where low wattage is used in conjunction with large storage capacity recuperation can take place at any time since load limiting devices are not necessary.

ITEM 4

As Mr. Nutting pointed out, the cost of the heater, whether high or low wattage, will to a large extent depend on the manufacturer. However, the cost of installation is an entirely different matter. The majority of electric water heaters are not sold to new homes but to homes where electric wiring has been installed for some time. Low wattage heaters can usually be connected on to these lines without change, but high wattage frequently require a heavier service entrance. The cost of these changes will often prevent the sale of a water heater if the customer is required to pay them. If the utility absorbs these charges they must be paid for through a higher rate.

ITEM 5

Mr. Nutting's discussion on the desirability of a simple and reliable installation is quite complete and requires no comment, with the exception that it is frequently found necessary to require the installation of a double throw switch between the range and a high wattage water heater in order to prevent excessive loading of the service transformer. As previously pointed out, the use of such a switch often tends to restrict the supply of hot water when it is most needed.

The foregoing discussion has been restricted to the five fundamental points which are necessary to give the customer satisfactory service. In addition to the points previously mentioned, there are additional features which should be given consideration.

In rural communities the distribution network and service transformers are comparatively light and usually are not capable of handling the heavy loads imposed by high wattage equipment. If it is necessary to replace the network and transformers in order to serve these heaters the investment is prohibitive. On the other hand, low wattage heaters (1 to 1½ kw.) can usually be connected on without any change. It has been the writer's experience that the 30 gal. capacity rated at 1½ kw. will serve from 90 to 95 per cent of the families using electric water heaters.

The high wattage, small capacity heater appeals to the small user of hot water. This is a stumbling block since the small use of current results in a very high proportion of fixed charges against the heater and the amount of current consumed and paid for will not be great enough to absorb these fixed charges. It follows, therefore, that this small user must be served either at a higher rate or else at a loss.

Mr. Nutting maintains that if it is feasible to prevent wash day from coming on the system peak that the diversity factor of 5 kw. water heaters can be close to 5 to 1. How close the diversity can be to this figure is not known but basing calculations on the ideal 5 to 1 diversity he shows that the cost to serve a 5 kw. heater even under these conditions is over 25 per cent greater than to serve a 1 kw. heater which is operating under ordinary conditions.

The low wattage heater has proved its position as a load builder and as one which can be served at a low price. Under ideal conditions high wattage may give a good load factor, but experience has shown that when these conditions change the utility is saddled with a lot of heaters which must be served at a loss unless it is possible to increase the rates with the consequent difficulties and customer dissatisfaction.

The Incandescent Lamp

A Letter from Mr. Kenneth Swan

Editor's Note: It is felt that since the following correspondence is self-explanatory, no editorial comment is necessary.

To the Editor:

In an article by Mr. Ernest Greenwood, published in the N. E. L. A. Bulletin of October, 1929, entitled "Behind the Veil," there are certain statements made or quoted with reference to Sir Joseph Swan's work on the incandescent lamp which appear to me to be inaccurate, and certain suggestions made which are unfounded and injurious, and I rely on your sense of fairness to allow me to correct them.

The article quotes Mr. Fleming (now Sir Ambrose Fleming) as saying, "Early in 1880 Swan devised an improvement upon the form of carbon conductor which he used in his 1878 lamp. He had evidently recognized that carbon could not be obtained in so suitable a form by cutting down a large mass of carbon as by carbonizing some organic material already in filamentary form." The fact (with which Sir Ambrose was probably not then acquainted) is that Swan had as early as 1860 recognized the suitability of fibrous organic material in filamentary form, and had produced perfectly satisfactory carbon spirals and horseshoe forms from paper (sometimes parchmentized paper) and cardboard, and had carbonized these by heating them to a high temperature in charcoal powder; the filaments so produced were exceedingly strong and flexible. He experienced difficulty, however, in mounting these filaments, and therefore as temporary expedient, in order more speedily to test the question of the durability of the lamp having a carbon filament mounted in vacuum, he had thicker filaments lamp made by Carre in Paris. It was one of these filaments which was used in the lamp shown in December, 1878.

Meanwhile he continued his experiments to devise means of getting a stronger filament having the characteristics of his paper spirals and horseshoe filaments, and in pursuance of these researches he hit upon the idea of using parchmentized cotton instead of parchmentized paper. He had been familiar with the method of parchmentizing paper and other fibrous materials for many years past. This parchmentized cotton filament became the basis of the early commercial manufacture of lamps in England and on the Continent.

What hand had Edison in this? In what way is it suggested that he contributed to this result? The suggestion seems to be made in this article that Swan was influenced by what Edison was doing and copied his work. This is quite untrue. Swan had no means of knowing what Edison was doing except in so far as the American newspapers from time to time purported to give accounts of Edison's achievements.

Swan heard, no doubt, in this way of Edison's use of paper and cardboard filaments and wrote to *Nature* to say that he had made filaments of this nature many years ago.

It is wholly untrue to say that Swan's work or ideas were in any way influenced by Edison's experiments. On the other hand, one might ask why was it that Edison, who in 1877 and 1878 had tried carbon and given it up as hopeless, suddenly recommenced experimenting with carbon "in the fall of 1878," to quote the date assigned by Mr. Greenwood. It has been suggested, but whether truly or not I do not know, that this sudden volte face of Edison's was due to his hearing of Swan's success with his carbon filament lamp "in the fall of 1878."

Swan's first public exhibition of his carbon filament lamp in December, 1878, was ten months before the date of the achievement of Edison, which the United States have been celebrating.

It is said in the article that Swan's lamp of December, 1878, was discarded as commercially impracticable. This is quite untrue. It was certainly not as practical a form of lamp as those which Swan made a few months later, but it was in no sense discarded. It satisfied Swan that he had solved the problem, and he at once set about improving the filament. Similarly, ten months later, Edison produced a lamp with a slender carbonized sewing cotton filament. Was this a practical form of lamp? Admittedly it was not. And accordingly Edison set to work to find a practical form of filament; trying first of all paper and cardboard, and as these proved unsatisfactorily, resorting ultimately to a special species of bamboo.

No exact date, so far as I can discover, is assigned either to Swan's first use of parchmentized cotton or Edison's first use of bamboo. Both events are placed early in 1880.

But priority seems to me after all to be a matter of minor account. The question is to whom is the world indebted for the lamp? No doubt America is greatly indebted to Edison in this matter, and equally beyond doubt England is wholly indebted to Swan.

As regards the invention of the means of producing a satisfactory carbon filament, there can be no question that the world owes more to Swan than to Edison.

The parchmentized carbon filament of Swan's invention was far more widely used than Edison's bamboo filament, and, in fact, outlived it until it was itself superseded by Swan's invention of the squirted filament, which became universally used—and gave rise to an enormously increased use of the carbon filament lamp.

Kenneth R. Swan.
London, Nov. 5, 1929.

Mr. Greenwood's Reply

To the Editor:

I HAVE your memorandum accompanying a letter from Mr. Kenneth Swan, son of Sir Joseph Swan, in which he takes exception to my "Behind the Veil" article, subtitled, "Corralling the Incandescent Lamp," in the October number of the N. E. L. A. Bulletin, on the basis that it contains implications with regard to the work done by his father and by Thomas A. Edison on the incandescent lamp which are unfounded and injurious to his father's work.

I appreciate the spirit in which Mr. Swan's letter is written. An account of history, after all, is of little value if it contains inaccuracies or if it ignores statements by those whose position entitles them to having their statements treated with regard. In the history which I have been furnishing you in the series entitled "Behind the Veil," I have endeavored to be as accurate as possible, and I most certainly have had no thought of according credit where credit is not due. I think, perhaps, that my last article giving unlimited credit to Michael Faraday when I might have, with just a little bit of mental gymnastics, divided the credit between Faraday and the American Joseph Henry, is evidence of this.

After calling attention to the fact that I quoted Sir Ambrose Fleming as saying "early in 1880 Swan devised an improvement upon the form of carbon conductor which he used in his 1878 lamp" and that "he evidently recognized that carbon could not be obtained in so suitable a form by cutting down a large mass of carbon as by carbonizing some organic material already in filamentary form," Mr. Swan says: "The fact (with which Sir Ambrose was probably not then acquainted) is that Swan had, as early as 1860, recognized the suitability of fibrous organic material in filamentary form, and had produced perfectly satisfactory carbon spirals and horseshoe forms from paper," and so on.

I agree. In this connection may I call attention to my statement in the article, as it appears on page 633, in which I say: "At various times, from 1848 to 1860, he (Swan) made a number of experimental lamps, all of them consisting of carbonized strips and spirals of paper and cardboard, coated with various liquids, which, on being heated, left a large residue of carbon. These lamps were operated in partial vacuum, either in a glass bottle having a wide neck closed with a rubber stopper, through which the connecting wires passed, or in a glass bell whose rim made a tight fit within the rim of a brass plate through which one insulated connecting wire passed, the plate being used as the other connection. Due partly to some trace of the air being left within the glass container, and partly to the carbons becoming distorted, the lamps soon broke down."

It seems to me that the only difference between Mr. Swan and myself in this connection is that he says "he experienced difficulty, however, in mounting these filaments and therefore as a temporary expedient, in order to more speedily test the question of the durability of the lamp having a carbon filament mounted in vacuum, he had thicker filaments lamp made by Carre in Paris," while I go into some detail as to these difficulties. Certainly, I would be the last to deny that Sir Joseph Swan was experimenting with carbonized fibrous materials in the hope of producing a practical filament for an incandescent lamp long before 1879. However, it seems, according to Mr. Swan's letter, that it was the thicker filament made by Carre which was used in the lamp shown in December, 1878. Also, Sir Ambrose Fleming has stated that one of these lamps is now to be seen in the National Science Museum in London.

Mr. Swan goes on to say that his father, Sir Joseph, "continued his experiments to devise a means of getting a stronger filament . . . and in pursuance of these researches he hit upon the idea of using parchmentized cotton, instead of parchmentized paper." He then asks: "What hand had Edison in this? In what way is it suggested that he contributed to this result?"

Mr. Swan follows these questions with the statement that "it is wholly untrue to say that Swan's work or ideas were in any way influenced by Edison's experiments." May I say that in this connection I was most careful to quote an English authority—or one whom I feel I had every reason to accept as an authority. It was Sir Ambrose Fleming, D.Sc., F.R.S., whom I quoted as saying: "Toward the middle, or close, of 1879, Swan and Stearn became aware that Edison had abandoned the use of metallic wires and had applied for patents for an incandescent lamp containing a 'filament' of carbon." If Sir Ambrose cannot be considered an authority, or if it can be shown that he had no personal knowledge of the facts, then, of course, I can only regret that I accepted his statement as a statement of known fact. The same "mistake," however, was made by the *Journal of the Institution of Electrical Engineers* (British), for this statement appears in the February, 1929, number of that publication.

I am inclined to agree with Mr. Swan that this whole question of presumptive dates as to when the first lamp to use a carbonized cotton thread as a filament was actually lighted by passing an electric current through the filament is a matter of minor account, and that the same thing is largely true of the lamp with a bamboo filament. The fact remains that Edison's first cotton thread lamp actually burned for forty hours beginning on October 21, 1879, and that on December 21st of the same year Mr. Edison gave a public demonstration consisting of "about sixty lamps mounted on poles lighting the laboratory grounds and country roads in the neighborhood" and also in "several houses." Mr. Swan places the first use of parchmentized cotton by his father as early in 1880 and at that time Edison had already discarded cotton for other filaments which would give his lamps several hundred hours of life.

I would like to add that in my opinion entirely too much stress has been laid on the question of the "practical incandescent lamp" and not enough on the question of a "practical system of lighting by means of incandescence." The lamp itself might almost be considered as a symbol. It would have been of little value without the solution of the problem of sub-dividing the electric current successfully — which scientific men in England of that time said could not be done; without Mr. Edison's constant voltage dynamo; his system of distribution; or the countless other things he had to invent before the first central lighting station went into operation. Personally, I am more than willing to abandon all discussion as to priority with regard to the first cotton filament lamp which could actually be lighted, although, at the same time, holding to my original opinion. It is a matter of no moment. Light's Golden Jubilee, as held in the United States during 1929, was a celebration of the fact that Mr. Edison did give to the world a complete system of artificial lighting by incandescence as we know it today, and I cannot admit that this is not a fact.

Ernest Greenwood.

New York, Nov. 18, 1929.

Correction

THE article on page 698 of the November N. E. L. A. Bulletin entitled "Mr. Arkwright's Address at Port Huron" should have been headed "Mr. Davidson's Address at Port Huron" and the reference to Mr. Arkwright in the Editor's Note, of course, referred to Mr. J. E. Davidson, president of the Nebraska Power Company and past president of the N. E. L. A., rather than to Mr. P. S. Arkwright, president of the Georgia Power Company and also a past president of the Association.

The editor regrets very much this mix-up in identities.

Service Suggestions

NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman*, Public Service Co. of Northern Illinois, Chicago, Ill.

To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 78 December, 1929

Bill Delivery Policies

By Customer Relations Committee, Great Lakes Division, N. E. L. A.

An important phase of customer relations is the delivery of electric service bills. This is a monthly contact, the value of which cannot be stressed too much. Bill delivery is the culminating step in the processes of rendering bills. Every effort should be exerted to insure the delivery of the bill at the proper time and at the proper place. Three methods of bill delivery are in common use: United States mail; delivery by specialized bill deliverers; and delivery by meter readers. In making a decision on any plan of delivering bills several factors must be considered. In addition to the item of cost there is the public relation question involving the effect of the plan on both the customer and the company. Circumstances in a large measure determine what practice is standard in each particular case.

Delivery by United States Mail

Delivery through the mails has found favor with a large number of utilities who base their plan exclusively on public relations. Its main advantages are positive delivery, absence of annoyance to customers, and the additional privacy obtained by enclosing the bills. In addition, a factor of economy enters due to the elimination of a large number of "no bill received" complaints. One utility has reduced this type of complaint 60 per cent by changing from hand delivery to mail delivery. Another advantage lies in the immediate return of unclaimed bills of customers who have moved. Where customers are out of town during the summer months, and leave a mailing address, the bills are automatically forwarded to them.

Delivery by Specialized Bill Deliverers or Meter Readers

Where the plan of delivering the bills is employed, it is usually applied only to the metropolitan areas, the bills for the outlying, scattered districts being mailed. The reason for this variation is that where the distances between houses are great, delivery by hand ceases to be economical.

The plan of hand delivery of service bills is based on economy and public relations. The unit cost of hand delivery in well populated areas is less than half the mailing cost. While the labor cost of delivery is from 6c. to 8c. per bill, the mailing cost is 2c. per bill plus the costs of folding the bills, inserting them in envelopes, and stamping. One company is mailing postal card bills, but its experience has been unsatisfactory and enclosed bills are soon to be substituted.

Light and power companies frequently have problems of policy or procedure on customer relations matters which are difficult of solution. It is the function of the Customer Relations Committee to aid companies in solving such problems. The committee will be pleased to receive requests for opinions of its members and will also endeavor to obtain the experience of operating companies for your guidance.

Address such requests direct to the chairman.

H. T. East, *Chairman,*
Customer Relations
Committee,
1427 Edison Building,
Chicago, Illinois.

It is claimed by the companies using hand delivery methods that economy may be obtained without injuring public relations. By the selection of dependable, and efficient employees for delivery, and the introduction of penalties for errors and failure to deliver bills according to instructions, a higher degree of customer satisfaction can be obtained than that resulting from mailing the bills. Very few "no bill received" complaints are experienced, and customers are well satisfied with the plan. In the hand delivery of bills, two variations are employed: delivery by a specialized group of bill deliverers, and delivery by meter readers who intersperse this function throughout the month with the reading operation. The former plan may prove more economical since specialization tends to produce efficiency, and since employees for such a simple operation can be often obtained at a lower wage. For the latter plan, however, it may be said that the results obtained through the use of older, more experienced, and more dependable men, warrant the slight additional cost.

Qualifications of Bill Deliverers

The men selected for this work should be mature, neat appearing, and have a sense of responsibility. They should be intelligent and dependable. A person bearing these qualifications will gain the confidence and respect of the customers and will aid in improving public relations.

Incentives for Efficient Bill Delivery

All wage plans should consider means of providing incentives for efficient and positive bill delivery. This is usually accomplished by profit sharing plans for the production of correct work, and penalties for incorrect work. This bonus may take the form of an increment to be added to the wage, or the incentive may be the wage itself as determined by the previous month's production. The incentive should do much toward improving the efficiency of the men and reducing the number of no bill complaints.

Among the plans of payment to increase the efficiency of bill delivery, two types will be explained.

1. The output in bills correctly delivered per month determines the hourly rate of wage.
2. A standard time for delivering a certain number of bills is obtained by time study, and savings accomplished by employes are shared with them on a percentage basis.

Place of Delivery

Where the bill delivery plan is followed, bills are usually placed in envelopes before being delivered to customers' premises. Some companies insist on handing bills to an individual on the premises. Where this is not possible, the bill is returned to the office and mailed.

Returned Mail and Inability to Deliver Bills

When bills are returned by the postal authorities they are turned over to the collection division for investigation and delivery to the customer. The bill should be in the customer's possession for a reasonable length of time before collection action is started. In the attempt to locate customers, information can be obtained from cartage companies, the post office, credit bureaus, neighbors, etc.

Relation of Reading, Delivery, and Discount Dates

Utilities should maintain, as far as possible, the same schedule in all three operations from month to month. If the period varies between any two operations the variation forms a potential source of complaint. In maintaining the same schedule, the customer gets in the habit of budgeting his expenses, whereas variations will cause requests for special dates. Maintaining a standardized schedule instills confidence in a customer who will then be assured of bills for a full month's service each month.

Conclusion

In making a decision as to the best plan of bill delivery, the important factors to be considered are public relations and cost. Character of territory, density of population, and number of customers will determine whether or not positive delivery is best accomplished under one plan or the other. Where facilities are not provided for the proper education of employees, from a public relations standpoint, or such an educational program does not appear economical, the plan of mailing bills will undoubtedly be the best. Where facilities for employees' education are provided, and the help is available, many of the benefits of the mail delivery can still be obtained by the less costly hand delivery.

National Analysis of Bill Delivery Practices

THE foregoing article is a résumé of policies and practices employed by companies in the Great Lakes Division. It was prepared and published by the Customer Relations Committee, Great Lakes Division, N. E. L. A. Since the findings showed that practices varied widely, the National Committee decided to make an investigation of the bill delivery policies in other sections of the country where the governing factors might differ because of character of population, prevailing wage scales, density of population, and prompt payment discount policies.

Reports were obtained from thirty-five representative gas and electric companies in the United States and Canada. For the most part these were large companies, although some operated in strictly metropolitan areas while others served larger territories with scattered populations.

Analysis of the thirty-five reports received showed that approximately 60 per cent of all bills are delivered by United States mail. It is interesting to note that practically every company which reported had at one time or another tried the hand delivery system, and nearly all admit having experienced difficulties, such as failure to deliver, leaving bill at wrong address, bills thrown on porch or hall floor, objections of postal authorities, and claim of customers that bill was not received. Practically all of the companies now using United States mails have discarded the hand delivery in favor of mail delivery after carefully analyzing the advantages of the two plans and reaching the conclusion that the admitted greater cost of mail delivery is justified by increased efficiency, added dignity and other advantages.

Another consideration frequently mentioned was the fact that where hand delivery is used it is necessary to supplement it by mail delivery to a certain percentage of customers due to customer's preference, isolated locations, type of mail box, or other reason. It is, therefore, necessary to make provision for mailing bills to a portion of the customers (this varied from 5 to 50 per cent) necessitating mailing facilities and personnel. Many companies apparently felt that since most of their bills must be mailed, it would be better to establish a uniform policy and mail all bills, since in no instance would it be possible to deliver 100 per cent of the monthly statements by hand.

Many companies, among them some of the larger ones, print their bills on standard United States postal cards which cost one cent for paper and postage. One end of the card is used as a stub, being perforated or marked for chopping, and this stub is retained by the company for accounting purposes after the bill is paid. Where the postal card is used care must be taken to avoid showing arrears, or at least indicating arrears as such, since postal regulations forbid any information on the postal cards which might embarrass the recipient. One company which uses postal cards exclusively incloses them in an envelope when they carry arrears. The principal argument in favor of postal cards is that it provides the advantages of mail delivery at a cost which compares very favorably with hand delivery. Objections offered to this form are the small amount of space available for the bill and lack of dignity. Notwithstanding these objections, this method of billing and bill delivery is successfully employed by some of the largest and most progressive companies who report they are entirely satisfied with the plan and would not consider any change.

Many of the companies which use mail delivery claim one of its advantages to be the opportunity provided for sending company notices, advertising matter, and other communications in the same envelope. This plan can also be used where hand delivery methods are employed.

Seven of the reporting companies using the hand delivery method do not inclose their bills in envelopes, thus effecting a further economy. The majority, however, feel that bills should be inclosed in envelopes for protection and to insure privacy.

Any analysis of the bill delivery policies of companies throughout the United States and Canada must take into consideration the conditions which would naturally influence the selection of the plan. In certain sections, notably the Northeastern States, rate schedules do not contain any prompt payment discount provisions. Many companies in this territory deliver bills by hand and attempt collection of the bills at time of delivery. Thus the men delivering bills are in one sense collectors. This practice is born of the desire to effect early collection. The companies with prompt payment discounts do not have this problem.

The prevailing wage scale for employees who deliver bills also has an important bearing upon the decision as to the plan to adopt. Some reporting companies pay their bill deliverers three times more than other companies. Since the principal reason for hand delivery is its economy, the cost of hand delivery due to wage scales must, of course, be carefully considered, and companies operating in territories where the prevailing rates of pay for such help are low naturally have a greater incentive to use hand delivery methods since the saving effected over mail delivery would be correspondingly greater.

Post Office Requirements

One of the principal difficulties experienced in hand deliveries is the objection raised by postal authorities to placing bills in customers' mail boxes. This question has confronted utility companies all over the country. Inquiries made at the Post Office Department in Washington bring forth the information that the Department has issued instructions to the effect that postmasters should take steps to discourage the use of mail receptacles for other material than United States mail. This is an instruction, no legislation having as yet been passed on the subject, except as regards the use of rural mail boxes. In some cities the postal authorities have taken active steps to forbid the use of mail boxes for public utility bills. In other cities the postmasters have permitted the use of boxes without objection with the understanding that the practice was not to interfere with the use of the boxes as a receptacle for the United States mail. In the larger cities many of the newer apartments are equipped with mail boxes which do not have an opening, the postman being provided with a key with which to open boxes when mail is delivered. Where such boxes are used some other delivery method must, of course, be employed.

Although the objections of the postal authorities have been successfully met in most instances, this is a phase of the situation which deserves careful consideration when considering any change in policy.

Conclusion

A study and analysis of the bill delivery methods employed in various sections of the country discloses a wide variation in practice. Each plan has its opponents and proponents. Each has its advantages and its disadvantages. It is significant to note that although practically every company has at some time or another delivered mail by hand, the majority of bills sent out by the industry is now carried by United States mail. The trend is decidedly in this direction. On the other hand, considerable saving is effected by hand delivery, and if this work is done by capable employees under careful supervision, many of the disadvantages can be avoided.

Our investigations prove that there are many elements to be considered upon a company bill delivery policy, and it is recommended that each company consider its present policy after giving consideration to the experience of other companies in the matter.

Women's Opportunity

(*Continued from page* 776)

by others. The big problem for the leaders of our industry is how to create an environment so that employees will become so interested in their work that their main thoughts are not going to be for quitting time and pay day.

Pride is a stepping stone to success in any venture, and one with ambition is easily led to take pride in his work.

Some of us are taking the work of the Women's Committee seriously and incorporating it into our daily work. This work we have repeatedly likened to that of builders, and since we laid the corner-stone at this place two years ago we have gone a long way in the building of this electric structure. Longfellow places this type of work way at the head of the list in its innate value when he says, "To build, to build! That is the noblest of all arts. Painting and sculpture are but images, are merely shadows cast by outward things on stone or canvas, having in themselves no separate existence. Architecture, existing in itself and not in seeming a something it is not, surpasses them as substance shadow."

Living and working to build up this electrical structure is bound to react on the workers, for we are dealing with creative energy, with the very stuff of which great ages and great empires are made. We are now living in an age when we are taking force from the elements and turning it to the good of man. This thought gives us great delight, and some day some poet may tell the epic of this Electrical Structure upon the building of which we of today are working.

Oh, to be alive in such an age
When progress rides her chariots high,
And on the borders of the sky
The signals of the century
Proclaim the things that are to be—
The rise of woman to her place,
The coming of a nobler race.
Give thanks with all thy flaming heart—
Crave but to have in it a part.
Give thanks and clasp thy heritage—
To be alive in such an age!

The Domestic Load

(*Continued from page* 782)

I am convinced that a careful analysis would reveal that there are no more electrical accidents and electrical fires in those areas using the standard electric code as a guide than are reported in the sections which supplement the code with special rules and regulations demanding unusually strict requirements.

Please understand that we are not recommending that the bars of safety be let down. The power companies are the ones to bear the blame when accidents occur and they will not countenance any careless practice. They do not favor and will not endorse any sub-standard materials or appliances. They do not want their service to pass through bad lamp cord or poorly designed bell-transformers. There is a life-long contact with the consumer and selfishness alone would dictate that the standards of service be high.

Years of experience have shown us that our original traffic rules were too severe and they have been amended with no apparent increase in hazard. Football rules are revised annually, with the object of making a game more enjoyable to the grandstand; that is, to the ultimate consumer. The automobile industry and the sporting fraternity recognize the merit of our text, "Thou shalt neither vex a stranger, nor oppress him."

Every word of this paper has been written with this text in mind. I am not fretting about the electrical contractor; I am not complaining about our competitors; I am not scolding the inspectors. All that I have tried to do is to speak a word in behalf of the consumer of electricity, who wants to use this modern servant and who considers you his counsellor and aid in securing maximum protection at minimum cost.

ELECTRICAL RESEARCH STATISTICS

December, 1929

Issued Monthly by Statistical Research Department of the National Electric Light Association
420 Lexington Ave., New York, N. Y.

H. A. Snow, *Chairman, Statistics Committee, Accounting National Section*
Wm. M. Carpenter, *Economist*

H. S. Bennion, *Director of Engineering, N. E. L. A.*
Merle Rainey, *Statistician*

The National Electric Light Association, a voluntary organization of companies and individuals affiliated with or interested in the electric light and power industry, organized to advance the art and science of the production, distribution, and use of electrical energy for public service.

The Association maintains a Statistical Research organization which collects, interprets, and makes available basic statistical information on the electric light and power industry. The publications and services of this department are available to all those interested, on request.

Current Statistics of the Electric Light and Power Industry

(*As of September* 30, 1929)

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 86 per cent of the industry.

	AUGUST		Per Cent Increase	SEPTEMBER		Per Cent Increase
DURING MONTHS OF AUGUST AND SEPT.	1929	1928		1929	1928	
*Kw-hr. generated (net)	7,769,016,000	7,029,816,000	+10.5	7,604,120,000	6,828,974,000	+11.4

*By courtesy of the U. S. Geological Survey with deductions for plants not considered electric light and power enterprises.
**As reported by 178 companies only, included in figures below.
***Increase first nine months.

Basic Information on the Electric Light and Power Industry

As of September 30, 1929; (100% *of the Industry*)

1. Value of plant and equipment (estimated)	$10,450,000,000*
2. Total generating capacity in kw	28,829,000
Steam	20,939,000
Waterpower	7,578,000
Internal combustion	312,000
3. Total number of customers served	23,878,000
Farm customers (as reported by 178 companies only)**	(236,000)
Domestic customers	19,673,000
Commercial customers	
Small light and power	3,613,000
Large light and power	559,000
Others	33,000
4. Population in electrically lighted homes	82,600,000
5. Percentage of homes which are served with electricity	68
6. Miles of transmission lines (11,000 volts and above) (circuit miles)	159,000*

* Subject to revision. ** Included below.

Operations of the Electric Light and Power Industry During September, 1929

FOLLOWING two months of unusual industrial activity in July and August, the statistical summary of the output of electricity in September shows a small relative decline when allowances are made for the seasonal expansion which should normally take place at this time. Business during September continued, nevertheless, at a very high level, and the sales of industrial power for the first nine months of 1929 reached a record total of 34,250,000,000 kw-hr., an increase of 4,120,000,000 kw-hr., or 13½ per cent over the corresponding period of last year.

These increased requirements of energy by the nation's factories, together with the continuance of unusually dry weather, have placed a heavy demand upon the steam plants of the interconnected systems. In September, the generation of electricity by water power was only 31 per cent of the total output. This is the lowest ratio since the dry weather period of October, 1925, and compares with a ratio of 43 per cent in May, and 38 per cent in September, 1928. During the month, the total hydro-electric production was 12½ per cent below that of August and 12 per cent below that of September, 1928.

As a result, the capacity factor of the steam plants apparently reached the highest figure since the disturbed years of the war-time period. In September, 1929, the steam stations operated at approximately 35 per cent of rated capacity and the waterpower plants at 44 per cent, as compared with an average of 29 per cent for steam and 52 per cent for waterpower for the entire year of 1928.

Large Increase in Domestic Service

Coincidently with the growing demands of industry, the use of electricity in the home has, this year, shown a remarkable increase. For the first nine months of 1929 total sales of domestic service were 6,971,000,000 kw-hr., an increase of 971,000,000 kw-hr., or 16 per cent, over the figure for the corresponding period of last year. At this rate of increase (with the reservation that the influence of the recent stock market collapse upon the purchasing habits of the domestic consumer and therefore upon the continuance of this high rate of use has still to be evaluated) the total use of domestic electricity during the entire year 1929 should approximate 9,800,000,000 kw-hr. This figure for domestic service alone is greater than all sales of electricity twenty years ago.

The course of sales, revenues and average prices of electricity sold to all consumers is shown in the diagram where the solid line represents actual figures for each month and the dotted line the average for the twelve months' period. For the year ending with December, 1928, the average revenue per kw-hr. sold was 2.64 cents; for the year ending with September, 1929, it stood at 2.57 cents—a decrease of 2½ per cent.

ACCOUNTING SECTION

W. R. Emerson, *Chairman* **Fred W. Herbert**, *Director, Accounting Section, N. E. L. A.*

Group Meeting Accounting National Section

By Fred W. Herbert

The group meeting, held at Chicago, Oct. 24-26, demonstrated that the Accounting National Section is doing its part in meeting all the requirements of the industry and is endeavoring to keep pace and possibly just a lap ahead of the requirements. This particular meeting was probably the largest and most constructive group meeting ever held by the section.

The morning of the first day of the meeting was devoted to a get-together meeting for the informal discussion of section and individual company accounting problems. This meeting was followed by a luncheon which many members of staffs of the operating companies in Chicago attended. About two hundred and fifty were present.

Following the luncheon a session was held in an adjoining meeting room. An interesting talk was made by Henry Swift Ives, special counsel of the Association of Casualty and Surety Executives, on the subject of "Industrial Accord." Mr. Ives stressed particularly the necessity of closer cooperation of the insurance field with the public utilities and stated that it was up to the accountants to bring this about. In the course of his address, Mr. Ives said: "Education, in the academic sense, has made tremendous, and sometimes even frantic efforts to broaden the horizon of the citizen so that he may keep pace with the achievements and aspirations of his fellows and so that his fellows may keep pace with his aspirations and achievements. But education which ends with a diploma is not enough. The uncultured have no monoply upon the static mind. The tide of events is rushing onward too furiously to permit of any letup in the acquirement of knowledge, especially such knowledge as has to do with economic and social progress and well-being. If this tide is to be properly controlled and guided toward the destiny of our hopes and dreams it must be controlled and guided by the aggressiveness of intelligence.

". . . Such perceptions of the economic and social order may only be found among broad visioned men who have carried their education beyond the diploma stage and who have studied the processes not only of the enterprises in which they are engaged but also have given attention to other enterprises to which their relationship is direct and constant.

". . . I often have said that a primary course in insurance economics is the greatest educational need of the average American business man, and you probably would counter with the assertion that a primary course in public utility economics is his greatest need. We both probably are stating truth and I am prepared to agree with you if you will agree with me."

Mr. Ives was followed by William H. Hodge of the Byllesby Engineering and Management Corporation who spoke on the subject of customer ownership. Although customer ownership has not been as active in the past two or three years, the principle of customer ownership when companies need further financing is as stable today as when it was originally instituted. Mr. Hodge also gave some helpful suggestions on the accountants' duties in relation to the financial structure of public utilities.

Paul S. Clapp, managing director, N. E. L. A. outlined some of the work of the other sections of the association and told how the accountants could add materially to the work of the association by coordinated action. He drew a beautiful word picture of the meeting at Dearborn in celebration of Light's Golden Jubilee.

Through the courtesy of George F. Oxley, director, Department of Public Information, N. E. L. A. Headquarters, there were shown a number of talking moving pictures of the Atlantic City Convention last June, with movietone talks by prominent members of the Association.

Through the courtesy of B. F. McGuire of the Commonwealth Edison Company, Chicago, arrangements were made for a bus ride over the City of Chicago, and an inspection trip to the stations of the Commonwealth Edison Company during the afternoon. This was an innovation which proved very enjoyable to those who took advantage of this bus ride.

The second day was devoted to individual meetings of the several standing committees of the section, the time being given over to the discussion and outlining of plans for reports and other activities of the section. These meetings were visited by the chairman, vice-chairman and a number of invited guests, who entered fully into the discussions. All the committees are fully organized, both as to national and geographic divisions and it is anticipated that a number of helpful serial reports will be issued by the several committees during this administrative year.

The Executive Committee of the Accounting National Section met on the third day. At this meeting reports were made by each of the chairmen of the standing committees and also by the chairman of each of the geographic division accounting sections. Reports from the geographic division representatives indicated that the divisions are fully organized and are doing much constructive work. A full representation of the accounting section from the geographic divisions at this meeting showed conclusively that a great interest has been stimulated in the geographic divisions in the work of the accounting section, and, with this increased activity, it cannot help but show greater results, inasmuch as the National Section is dependent largely on the work of the geographic divisions.

The Exhibit Committee, organized this year as a standing committee, reported that it is collecting forms and statistical data which will be very helpful to the geographic divisions, and that it is prepared to furnish charts, forms, and exhibit material to any geographic division which might desire to make a display at a convention.

The next group meeting of the Accounting National Section will be held at Detroit, Feb. 24, 25 and 26, 1930. Notice of this meeting will be sent from headquarters shortly. This will be the last group meeting of the accounting section before the annual meeting in June. The first two days of this meeting will be given over to meetings of the different committees and the executive committee. The third day will be devoted entirely to inspection of the plants in Detroit which manufacture mechanical appliances for billing, accounts payable, etc. Arrangements will be made through these manufacturers by which all members of the Accounting Section who desire to wait over for the third day can get full details on all office mechanical devices and an opportunity will be given also to visit Dearborn, the scene of Light's Golden Jubilee celebration.

A number of committee reports are now in press and a number in preparation, and will be available to the membership shortly.

A new committee to be called the Advisory Council is now in process of formation, the scope and membership to be announced in a short time by Chairman Emerson.

COMMERCIAL SECTION

MARSHALL E. SAMPSELL, *Chairman* C. E. GREENWOOD, *Commercial Director, N. E. L. A.*

Commercial National Section Committee Programs Formulated

THE prosperity of the country is now uppermost in the minds of everyone. The level of business progress is directly reflected in the sales and revenue of the light and power company, and perhaps the commercial executives have more to think about right now than other groups. Since transformer loadings are a fair barometer of prosperous industry, commercial men have the obligation of keeping those loadings at capacity.

"More Kilowatt Hours at Better Load Factor" is the slogan under which Chairman Marshall E. Sampsell is advancing the work of our Section this year. Every man in the commercial field can sense the need of vigorous selling of electric service in the coming months, new power and heat applications in commerce and industry, and the adoption of more electric servants in the home. These were the underlying thoughts which governed the committee chairmen in the development of their programs for this year.

F. D. Pembleton, chairman of the Merchandising Bureau, held a group meeting of the committees on Oct. 10, and M. E. Skinner, chairman of the Lighting Bureau, held a group meeting of the Lighting Bureau on Oct. 24 and 25. Meetings were called at the Westinghouse Lighting Institute through courtesy of Ralph Neumuller, director. A brief resume of crystallized discussion and proposed action follows.

Merchandise Sales Committee

With the purpose of placing merited stress on the domestic load, Chairman C. L. Harold has directed committee action into channels of research and promotion. The essential of complete knowledge of the market through local survey as a basis on which to build sales plans is now recognized. The committee is securing information on the surveys already made and recommending standard practise in investigation work. Through N. E. L. A. Headquarters the benefit of advice of both government and university agencies will be secured. Other committees are studying methods of approach to the home owner, and to the speculative builder, and promotion of the sale of complete electric home equipment to be financed in the mortgage of the new home.

The scope of activity of the Oil Burner Committee has been changed to include other house heating methods such as the hot water storage system and the automatic domestic stoker for small size coal.

The Farm Equipment Subcommittee is continuing to expand its field of endeavor to industrialize the farm and farmstead.

The interests of the trade and the advancement of dealer cooperative methods, sales stimulation through contests, and the establishment of radio selling by the power company are other important efforts of divisional committees.

Range Committee.

There will be ready for distribution about the time of publication of this issue of the N. E. L. A. BULLETIN a sales report on electric ranges representing the work of the committee. Greater interest by the "combination" companies, promulgation of uniform sales methods and circulation of promotional material, better range wiring methods, a study of the handicaps to electric range promotion, are important subjects that Chairman Coupal is taking under committee advisement. The problem of "servicing" ranges is to have more considerate attention.

Refrigeration Committee

The results of the National Food Preservation Program are being carefully reviewed. Chairman Dunn is highly pleased with the accomplishment of the National Food Preservation Council in executing the program of last year's committee. An exhaustive study of ways and means of taking full advantage of the momentum now gained through educational work, and building a plan of continuation is before the committee at this time.

Water Heating Committee

The progress being made by the Water Heating Committee was reflected in its meeting. Chairman N. T. Wilcox arranged for A. B. Morgan of the Headquarters' staff to give a brief review of his recent investigation which covered the greater part of the United States. Mr. Morgan reported a keen interest in water heating throughout the country. His trip was most profitable from a standpoint of determining the variation in the requirements of the different sections of the country, as well as from the large amount of data collected. The committee now has recent test data, aside from that published in the technical magazines, from Augusta, Me., Birmingham, Ala., Buffalo, N. Y., Cedar Rapids, Iowa, Dayton, Ohio, Detroit, Mich., Jackson, Mich., Minneapolis, Minn., Pueblo, Col., and San Diego, Cal. This data is supplemented by valuable tests and information from other sources. Data has been promised from as many more places. In accord with the national program, tests are now being conducted by the Potomac Edison Company and the Puget Sound Power and Light Company. The Seattle tests include several groups of heaters under both Summer and Winter conditions.

The program for this year's activities, which was accepted by the committee, includes the purchase of ninety Recording Ammeters to be used in obtaining the diversity of approximately that number of heaters in the Birmingham district, Miami, Florida, and possibly one other point in the Southeast, as well as in Rockford, Ill. The results of these tests on various types and sizes of heaters, together with the data already at hand, will be used as the basis for a report which, it is now contemplated, will be issued early in the summer of 1930. It was decided to hold the proposal for laboratory tests in abeyance until after the field tests had been made so that the results from these tests might be used as a background for determining the necessary laboratory measurements. The Southeastern division offered to cooperate with the national committee in order to expedite the work. This offer was accepted and the test program will shortly be under way in the Southeast.

Commercial and Industrial Lighting Committee

Men in the commercial lighting field have been impressed for the past few years with the need of definite action to overcome the lack of interest of the architectural profession in wiring needs of commercial and industrial buildings. On some of the newer buildings several thousand dollars expenditure has been required for more circuits before occupancy. Many of the power companies are now offering a lighting service, and attempt will be made to familiarize the architects with this service and also encourage other power companies to get into line.

The committee hopes to develop a code of ethics for the personnel, and suggestions for its practical application in establishing architectural contact. National conferences dealing with architectural phases of the wiring and lighting work of the Lighting Service Departments are planned, and the promotion of similar local schools to be held in geographic divisions, together with the development of model programs for these schools. There were two conducted last year by the Edison, and the National Lamp Works, for the training of lighting service men in their architectural relations. The courses will be improved and the work broadened.

The committee calls particular attention to these national conferences on architectural contact and on wiring phases of lighting bureau work. One will be held in Chicago and one in the East, probably in New York City, definite dates to be announced later.

The "Specification Paragraphs" of the committee have been completed and distributed.

Home Lighting Committee

There is now in preparation a course in home lighting which, it is suggested, should be added to the curriculum of domestic science schools in which the Illuminating Engineering Society will collaborate. The committee senses the need of a coordinated national activity to promote better lighting in the home and the use of better fixtures. A booklet on home lighting to be used in quantities for distribution by power companies is in contemplation.

Electrical Advertising Committee

The fundamental need of the industry is a Model Sign Ordinance and the Electrical Advertising Committee has completed one which has been reviewed for its legal aspects and has been accepted. It is hoped that it will be adopted by interested organizations and will be promulgated.

An important consideration is the organization of more schools on electrical advertising throughout the geographic divisions. The national schools have been well attended, but it is realized that the sectional schools will reach a greater number of men engaged in selling electric signs. A uniform program has been developed which will simplify the work of organization and operation of these sectional schools.

Street and Highway Lighting Committee

A comprehensive program is planned by the Street and Highway Lighting Committee with the development of six permanent sales reports to be kept up to date by periodic revisions. One report is to include compilation of street lighting installation data, comparing costs in respect to population of the city, length of installation in miles, spacing, lamp sizes of units, and other factors of importance. A second report will include compilation of data with special reference to enabling acts and legislation now in effect in various States influencing the method of installation of lights along State, county, township and village highways. A third report will contain information on the lighting of outdoor recreation centers such as football fields, tennis courts, etc. A fourth will be on aviation lighting. A fifth will contain information on street lighting sales methods of public utilities and manufacturers, and cooperation between utilities and manufacturers in promoting street lighting. Flood lighting of building exteriors and the design of flood lighting systems is included in committee activity.

Since an early completion of these reports is anticipated, there will be available to the industry some valuable helps in building the street lighting load.

Electric Truck Committee

A meeting of the Electric Truck Committee, Commercial National Section, was held at the Westinghouse Lighting Institute, New York, Oct. 31. The committee plans two major activities for this administrative year. An electric truck school will be held in San Francisco, just prior to the N. E. L. A. Convention in June, to acquaint power salesmen with facts regarding electric street and industrial trucks. An electric street and industrial truck advertising program also is being undertaken. An interesting series of advertising folders, pertaining to the use of electric trucks, is now being formulated by Dana H. Howard, advertising manager of the Commonwealth Edison Company.

It is proposed to carry out the advertising program in connection with a direct mail campaign being conducted by the Industrial Truck Association in cooperation with electric light and power companies, which is meeting with an encouraging response.

There is to be a group meeting of the Power Bureau on Dec. 10 and 11 at the Westinghouse Lighting Institute, New York City, when all the committees of that bureau will report progress on the programs that have been outlined for the administrative year.

Chairman Marshall E. Sampsell has called an Executive Committee Meeting of the Commercial National Section for Jan. 23, 1930, at the Edison Building, 72 West Adams Street, Chicago.

C. E. G.

$1,000 Prize for Electrical Advertising Promotion Again Offered

AN annual award of $1,000 in cash to the individual and a gold medal to the company making the greatest joint contribution to the promotion of electrical advertising has been made a permanent feature in the industry, according to W. J. Moore, supervisor, Electrical Advertising Section of the Society For Electrical Development.

The award, which was established by the Federal Electric Company of Chicago, was won in the opening competition by the Edison Electric Illuminating Company of Boston and presented to it by Marshall E. Sampsell, chairman, Commercial National Section of the N. E. L. A. C. L. Edgar, president of the Boston Edison Company, received the medal on behalf of his company and R. B. Brown of the Illuminating Engineering Division of that company was presented the cash award.

With announcement that the award will be a permanent feature in the industry, new attention was drawn not only to the Boston plan for developing sales, but also to the load possibilities of electric sign development where the activity is undertaken with a definite plan of promotion.

The plan and exhibits of the Boston Edison Company disclose that in addition to bringing in a revenue of $135,000 to the Edison Company, the campaign resulted in a gross business to the Boston sign trade of $292,500. Among other results obtained were the following: 1300 new signs sold; 1200 kilowatts connected; 900 old signs reconditioned; 400 time clocks sold; 1200 flashers sold; 20,000 color caps sold; 11,00 old signs relamped; 375 business time clocks rented; 350 maintenance contracts taken and 300 new maintenance customers acquired.

Writing of this successful campaign, which took into consideration nearly every form of market promotion, Mr. Edgar stated:

> "The promotion of electrical advertising secures two important results which should not be overlooked by the electric service company. First, from the consumers' standpoint it leads to increased prosperity by reason of its advertising value. Second, from the utilities' standpoint it represents desirable load because of its long-burning, off-peak characteristics.
>
> "For several years we have encouraged the use of electrical advertising throughout our territory. The results have been grati-

The Industrial Heating Committee Exhibit at the National Metal Exposition

THE National Metal Exposition was held at the Cleveland Public Auditorium, Cleveland, Ohio, from September 9 to September 13, 1929. This Exposition is an annual affair and was the eleventh successive one held under the auspices of the American Society for Steel Treating.

The annual technical meetings of the American Welding Society, the Institute of Metals Division-American Institute of Mining Engineers, Iron and Steel Division of the American Society Mechanical Engineers, and the American Society for Steel Treating, were held in Cleveland during the same week.

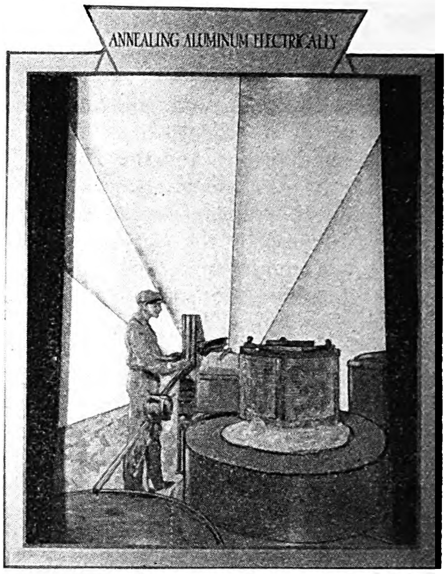
Practically every line of equipment dealing with the manufacture, heat treatment, and processing of metals was represented in the Exposition. More than 80,000 square feet in the exhibition hall was devoted to the displays of machinery and materials for this purpose. A large portion of this equipment was in operation under conditions as nearly as possible corresponding to actual service conditions.

In accordance with the practice of previous years, the Industrial Heating Committee of the Commercial National Section, N. E. L. A., contracted for 1000 square feet of floor space and held an exhibit at the Exposition.

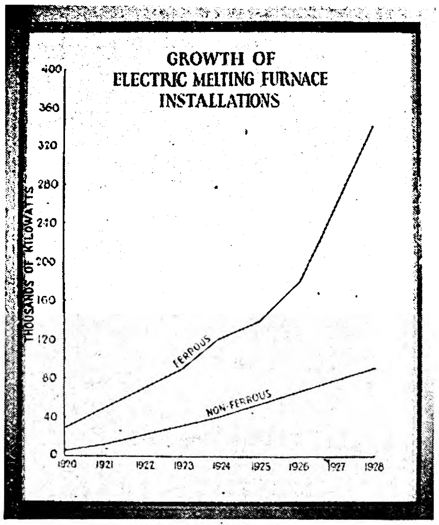
This year a decided departure was made from the type of exhibits used in the past. The exhibit was arranged and designed to attract attention by means of decorative features. The exhibit was radically different from other exhibits at the Exposition and so attracted attention by contrast. A full-length view of the booth is shown in photograph No. 1.

The entire length of the rear of the booth was made up of an ornamental display featuring in color four important applications of electric heat in the metal industry. At the left and right ends of the rear of the booth, illuminated charts were displayed showing the growth of electric heating installations over the period of years from 1920 to 1928. A close-up view of one of these charts is shown in photograph No. 2, and a close-up view of one of the pictures is shown in photograph No. 3.

The two panels containing charts were illuminated with a constant white light. The four pictures illustrating applications of electric heating were illuminated by concealed lighting. Three colors of lighting were used and arranged to work off a dimming device which gradually changed and blended the three colors. The illuminated panels were set in a draped black velour background. There was a cut-out scalloped valance along the top of the velour background. This was decorated in gold and black modern designs.



3.
Close-up View of Picture Used in Exhibit



2.
Close-up View of Chart Used in Exhibit

A large supply of literature pertaining to the use of electric heat in industry was distributed daily from the Industrial Heating Committee's booth.

The total attendance at the Exposition was 53,121. It is interesting to note that over 6000 members and guests of the cooperating societies registered. This list was composed of nearly half of the total membership of the societies and well over twice as many as have registered in previous years.

ENGINEERING SECTION

Alex. D. Bailey, *Chairman* **H. S. Bennion**, *Director of Engineering, N. E. L. A.*

Two-Rate Metering

By The Meter Committee

Engineering National Section, N. E. L. A.

Ways and means for increasing the use of electrical energy in residences have been studied for many years. One of the recent plans has been the offering of a lower rate for energy used for certain electrical heating devices, particularly during the off-peak hours. These devices include instantaneous water heaters, room heaters, storage type water heaters, and other commercial heat applications where the demand or energy charge, or both, are less between certain hours classed as the off-peak hours. The use of these rates has presented metering and control problems which the Meter Committee, N. E. L. A. has studied with a view of giving general recommendations on the best use of available equipment.

There are various ways in which such loads may be metered, but the equipment to be used must be determined by local conditions because of the wide differences in rate application and the varying requirements of operating companies with regard to peak and off-peak periods.

European Practice

For some years, European operating companies have been using watthour meters with two-rate registers. The high rate register engages with the moving element of the meter during peak hours, usually between the hours of 7 a.m. to 12 noon, and from 1 p.m. to 7 p.m. The periods between 12 noon and 1 p.m. and from 7 p.m. to 7 a.m. are usually classed as the off-peak hours, and the energy consumed is registered on the low rate register. The change from the high rate register to the low rate register is made by means of an electromagnet and gear-shifting arrangement mounted on the meter register and actuated either by a contact clock or by an ordinary hand operated switch. Some installations are so wired that if any load other than the heater is used, the electromagnet of the two-rate register is energized and the high rate counting train is engaged with the moving element of the meter. This practice necessitates double pole lighting circuit switches and a control wire from all switches to the meter. The two-rate register is also furnished with a maximum demand indicator. With this practice, the true kilowatt-hours consumed are not shown on the meter, which may or may not be objectionable according to the accounting requirements of the individual utility.

American Practice

Some of these European two-rate meters are in use in the United States for the measurement of off-peak loads.

In certain localities where there are rates covering off-peak use of energy for water heating, house heating, etc., the following methods of metering are in successful use:

1. Two ordinary meters are installed. One is used for the heater and is billed on low-rate per kilowatt-hour. The other is used for the balance of the installation and is billed on the regular rates.
2. Two ordinary meters are installed. One meter is connected through a time switch to assure off-peak use of heater current and to prevent on-peak use, and is billed on a low rate per kilowatt-hour. The other meter is used to measure the balance of the load for billing at regular rates.
3. One ordinary meter is installed. Current limiter is used to cut off the heater automatically when the range load is on.
4. One ordinary meter is installed with a graphic demand meter which shows the use of the heater outside of hours agreed upon in contract. A penalty charge is made for such use.
5. A heater is connected at a flat rate per month, with a check demand meter installed to insure that the size of the heater is not changed.

All the American utilities who have reported to the committee are using schemes similar to those outlined above. There seems to be a general feeling that special equipment such as demand limiters, time switches, etc., are too expensive for this class of service.

If the two-rate scheme of billing comes into extensive use there may be a demand for a meter designed particularly for measuring this class of load.

Further information on this subject will be presented by the meter committee whenever it becomes available.

Special Devices and Drainage Being Studied by Joint Subcommittee

In Inductive Coordination, as well as in many other situations, there occasionally arise problems that require a special form of treatment that would be both unnecessary and undesirable for general application. An investigation of devices of this character by the Joint Subcommittee on Development and Research brought out that drainage and neutralizing transformers for telephone circuits and filters and similar resonant devices for power circuits, give the greatest promise of practical application.

The study of special devices was assigned to Project Committee No. 8 by the Joint Subcommittee. The application of devices of this character involves an arrangement of a tuned circuit which will practically eliminate a given frequency from a circuit without seriously interfering with the normal operation of the circuit.

Sometimes direct current equipment produces one or two harmonic frequencies superimposed upon the direct current of sufficient magnitude to cause serious telephone interference. A tuned circuit consisting of condensers and reactors can be connected across the terminals of the equipment in such a manner that practically all the current of the given frequency, or frequencies, will pass through the filter and not be permitted out along the lines. Several successful applications of resonant shunts of this character have been made to both rotary converters and mercury arc rectifiers.

Another type of application of a tuned circuit is in connection with generators with grounded neutral, connected directly to transmission lines. Such generators sometimes have triple harmonic voltages, which are of such a magnitude as to cause serious telephone interference in existing parallels. In situations of this character, a circuit consisting of a condenser and reactor in parallel can be arranged in the neutral of the generator in such a way that it will offer high impedance for a given frequency in the voice range of the telephone system and a relatively low impedance for the fundamental frequency of the power circuit. There have been several installations of this character which have eliminated serious telephone interference from one or two triple harmonics of the generator without seriously interfering with the normal operation of the power system, or its relays.

Some consideration has also been given to the application of selective devices to telephone circuits. An ordinary telephone conversation involves the transmission of frequencies within the band from about 200 to about 3000 cycles. The removal of one or two harmonic frequencies in this range, which cause the major part of the noise, would involve also the removing of narrow bands of the transmitted speech current. Some consideration has been given to this application and it is planned to carry on sufficient work to determine its practicability, and the degree of improvement to be obtained.

The Joint Committee assigned to Project No. 11 the study of various special devices for both power and communication systems including drainage of telephone circuits. The purpose of drainage is to relieve a telephone line of voltages of such a magnitude as to seriously interfere with its use. The drainage of a telephone line involves the placing of coils between the line and ground at frequent intervals. The coils used for this purpose are arranged in such a manner that they give a high impedance between their line terminals and a low impedance to currents flowing from the two lines in parallel to ground. A drainage installation should be designed so that the voltage between any two coil points is not excessive, and furthermore, so that the effect on transmitting the telephone currents in the metallic circuit is minimized. The Project Committee has made a thorough study of the design and operation of two drainage systems on privately owned communication circuits which have been in operation for a number of years. The Project Committee has also studied characteristics of various standard coils which might be suitable for the application of drainage in given cases. One of the difficulties in connection with the application of drainage is due to the fact that a major portion of the commercial telephone systems carry direct current for telegraph or signaling superimposed upon the telephone circuits. Any means of applying drainage that is known at the present time would prevent the use of direct current in this manner on the telephone circuits.

The Project Committee has worked out the theory of drainage for a number of cases, including those in which the application would be most likely to prove desirable.

Correction

IN the November BULLETIN, page 734, in the article on the Electrical Apparatus Committee, there occurred an error relating to Fractional Horsepower Motors wherein it was stated that appliances equipped with the new motors would be generally available on Jan. 1, 1930. This date should have been June 1, 1930. The corrected item is as follows:

Fractional Horsepower Motors

It was reported that final agreement has been reached by appliance manufacturers and the light and power interests on the characteristics of single phase 110 volt motors of one-third horsepower and less. Most appliances are now equipped with motors of approved characteristics, and announcement was made that on June 1, 1930, those not now so equipped will appear on the market with motors approved under this agreement.

Prime Movers Committee Meeting

By ROGER D. DEWOLF, *Chairman*

A MEETING of the Prime Movers Committee was held in Boston, Mass., on Nov. 18 and 19, with a total attendance of 62.

C. F. Hirshfeld explained the organization and proposed activities of the Research Committee, of which he is chairman, and outlined in a general way the work which this committee proposes to carry on. W. V. A. Kemp has been appointed research secretary, and will be actively in charge of this work. Mr. Kemp plans to visit member companies and will welcome suggestions from members of the committee as to the work that the Research Committee should undertake.

Final reports were presented and referred to the Editing Committee by the following Subcommittees:

Boiler and Turbine Room Instruments
Coal and Ash Handling
Distillation Products of Coal
Power Station Betterment

Preliminary reports were presented by the following Sub-committees:

Stoker Equipment and Furnaces
High Steam Pressures
Pulverized Fuel
Boilers, Superheaters and Economizers
Condensing Equipment

On Nov. 19, at the invitation of the Stone & Webster Co., the meeting was held at the Somerset Station of the Montaup Electric Company. Automobiles were provided for taking all members from Boston to Somerset, where the plant was inspected and a buffet luncheon served by our hosts. Mr. Parks, general superintendent of the Montaup Electric Company, then gave us a brief historical outline of the origin of the company and the cooperative operation of the three companies using the output of this station.

A very interesting Round Table discussion was held at the plant in the afternoon and the committee members were then taken back to Boston or Providence, according to their transportation requirements.

The next meeting of the committee will be held in Rochester on Jan. 27 and 28, 1930.

Great Lakes Engineering Section Meeting

THE Annual Fall Meeting of the Engineering Section of the Great Lakes Division was held at the Loraine Hotel, Madison, Wis., Oct. 23 to 26, 1929. Some two hundred and fifty engineers attended the sessions which dealt with problems of engineering, construction and operation. The technical sessions were held throughout the first three days and the fourth day of the meeting was devoted to inspection trips and to sports.

The outstanding feature of the meeting was the discussion of power system stability for which papers were secured from nationally recognized authorities on the subject. Among the contributors of formal papers were Alexander D. Bailey, chairman of the Engineering National Section, Forrest Nagler, Hydraulic Engineer of the Allis-Chalmers Manufacturing Company, Robert Treat, General Electric Company; C. L. Fortescue, Westinghouse Electric and Manufacturing Company, J. H. Foote, Stevens & Wood, incorporated. Discussion was led by L. F. Hickernell, chairman of the Engineering Section of the Great Lakes Division and was participated in actively by the representatives of member companies who were present.

In addition there were reports on research activities and recent developments in the art of engineering as applied to electric utilities as well as administrative reports from the chairmen of all of the engineering committees of the Section wherein their activities for the current year were announced.

Power Group N. Y. Section, A.I.E.E. Holds First Meeting

THE first meeting of the Power Group, New York Section of the A. I. E. E. was held on Oct. 30 at the A. I. E. E. Headquarters.

The subject, "Generation and Development of Generators" was ably handled in the papers presented by H. B. Forbes of the New York Edison Company and C. M. Gilt of the Brooklyn Edison Company. The number of men who took an active part in the discussion, which followed the presentation of the papers, is indicative of the general interest taken in the meeting.

In accordance with the policy of the group, the meeting was called to order promptly at 7.30 p.m., and was adjourned about 9.15 p.m.

The next meeting of the group will be held on Dec. 9, 1929, and the subject will be "System Connections."

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

CANADIAN ELECTRICAL ASSOCIATION

P. S. Gregory, *President* **H. M. Lyster**, *Secretary*

Canadian News Letter

By H. M. Lyster

The organization of the Canadian Electrical Association for the current year was completed early in September and all the committees have met and laid out their programs for the year.

The Engineering and Commercial Sections have met and held group meetings, with subsequent meetings scheduled for soon after the new year. The other committees have met individually.

Following the Industrial Relations Committee Conference in Chicago and the recommendation that such a conference should be held in the various geographic divisions, a joint conference was held in Montreal by the Educational Committee, under F. R. Jenkins and the Industrial Relations Committee under A. B. Gates. This conference was attended by representatives from many of the large companies in the United States and all the large companies in Canada from Winnipeg east. This conference occupied one full day, in which matters pertaining to the education and training of employees in the industry were discussed.

This was the first meeting which the N. E. L. A. has held in Canada, and the executives of this association trust that it is a forerunner of many subsequent meetings in this territory.

Publications

The practice of the Canadian Electrical Association is to publish the committee reports in one bound volume after the annual convention, which "Proceedings" contain all the reports and discussions as well as the speeches made during the convention. The reports for the past year includes, in the Engineering Section a report of the Electrical Apparatus Committee, dealing with the new equipment or developments of the past year, and one of the Hydraulic Power Committee describing a few typical installations, but principally devoted to a report of a subcommittee dealing with the "Methods of Handling Ice and Heating of Sluice Gates and Trash Racks in Hydro-Electric Plants." The latter was considered of sufficient importance to be reprinted in pamphlet form and a limited number of these reprints are available for those requiring copies. This report is being adopted by the National Committee of the N. E. L. A. for further study and J. F. Roberts, the chairman of the subcommittee responsible for the drafting of this report has been appointed as chairman of the subcommittee of the N. E. L. A. committee for this amplification. The Canadian Hydraulic Power Committee is also active on another N. E. L. A. Hydraulic Power subcommittee, namely that of "Foreign Practice," under the chairmanship of Prof. E. Brown.

The Overhead and Underground Systems, and the Inductive Coordination Committees both presented reports which proved of considerable interest to our members at the convention, and they were responsible for a very interesting and active discussion.

The Commercial Section's activities for the past year consisted of the work of the following committees:

General Merchandising Committee.
Industrial and Street Lighting Committee.
Power Sales Bureau.
Wiring Sales Committee.

These committees presented very excellent reports, creating an active discussion at the convention.

The Canadian Electrical Association awards a Resuscitation Medal to any employee of a public utility company in Canada who successfully resuscitates anyone overcome by electrical shock. At the last executive meeting three such medals were awarded as follows:

Ernest Rogers, Chicoutimi, Que.
Albert Barnetson, Toronto, Ont.
Pierre Parent, Shawinigan Falls, Que.

EAST CENTRAL GEOGRAPHIC DIVISION

L. B. Herrington, *President* **D. L. Gaskill**, *Secretary-Treasurer*

East Central News

By D. L. Gaskill

Probably no feature of the work of the East Central Division is valued more highly than that of the standing committees. However, the Division has been working to do away with the system of having presented at the conventions annual reports of the standing committees, leaving detailed reports and discussions to be brought out at the committee meetings during the year.

Abbreviated reports setting out the nature of the work done during the year are published in the issue of the *East Central Division Monthly* preceding the annual convention, while addresses, covering in a more general way the work of the committees, are presented at the convention. The part that the standing committees should take in the annual convention is a very interesting study.

At the conference of Public Utility Association Secretaries, to be held in Chicago, Ill., beginning December 2, the secretary of the East Central Division will address the delegates on the question of whether the annual convention should be abolished and the work of the Division be given over entirely to conferences of the standing committees or whether the annual convention should be a substantial part of the Division activities. The speaker will say that the annual convention is still a necessity in association work, not only from the standpoint of business, but from the necessary standpoint of everyone in the industry becoming acquainted. When we come to weigh the profits of a meeting, it is probable that the greatest benefit derived is from the meeting of others engaged in the industry.

Experience of past years, however, has led the writer to the conclusion that detailed reports of standing committees along a particular line are out of place at an annual convention. The annual convention is the place where those prominent in the industry spread the gospel of advancement for the industry, and to attempt to confine it to any one line or to have certain sessions given over to one phase of work does not give the general satisfaction which a meeting that is interesting to all gives. For that reason the East Central Division has been moving toward addresses covering the general trend of the industry rather than to detailed reports, leaving the reports to be published in the Division's *Monthly*, or to come from the accounts of activities.

The writer believes that the annual convention is a very necessary adjunct of any association, and he also believes in the work of the standing committees. If a choice had to be made between the standing committees and their meetings as against the convention held annually, he would vote in favor of the standing committee meetings instead of the annual convention; however, a combination of both results in better work.

The date for the East Central Division convention has not been set. The Executive Committee will meet in the city of Dayton on December 12 to determine the date.

The high spot meeting of the year was held in Cincinnati on November 13 and 14—that of the Accident Prevention Committee. Over two hundred and fifty were registered in attendance and the two-day program was carried out in detail. One of the pleasant features of the meeting was the presentation of the Insull Medal to one of the Cincinnati employees.

West Virginia Association Convention

STRESS was laid at the twelfth annual meeting of the Public Utilities Association of West Virginia, which was held at Wheeling on Oct. 23 and 24, on the need for a higher caliber of service and a better understanding on the part of the public of the problems of utilities. Electrification of rural communities was also one of the major subjects discussed. There was an attendance of between 185 and 200 delegates from all sections of the State.

President A. Clint Spurr said that the public was being informed of some of the alleged mysteries surrounding public utilities, and he felt that the educational committees of the various organizations had done a great work along that line. He briefly traced the development of utilities in West Virginia and linked their growth with the growth of electricity all over the world.

R. S. Soule of Fairmont, educational director of the Monongahela-West Penn Public Service Company, talked on "The Conference Method of Improving Contacts." "Transportation Problems in West Virginia" was the subject of an address by Charles Gordon, managing director of the American Electric Railway Association. Safety work by the various utilities of the State was briefly discussed by W. A. Buchanon of Morgantown, A. Clint Spurr and H. F. Webb.

On electrification of rural communities R. Paul Smith of Hagerstown, Md., vice-president Potomac Edison Power Company, said: "There is an attitude among many rural communities that they have been shunned by the utility companies. The farmer is just as important in electricity consumption as the urban user."

A brief address on "Rural Electricity" was made by J. R. Howard of Washington, D. C., past-president of the American Farm Bureau.

A movietone message from Thomas A. Edison was given at the annual dinner, at which A. Clint Spurr was master of ceremonies, the principal speaker being H. C. Ogden, publisher of Wheeling newspapers, whose subject was Edison.

On the second day three members of the Monongahela-West Penn group made addresses on the general topic "The Right and the Wrong." Merchandising was the subject of George E. Whitwell, vice-president Duquesne Light Company of Pittsburgh, who observed: "Merchandising can well be divided into four parts. They are the actual selling, price, service and distribution. The best method of increasing sales is to persuade each employee to become a salesman through his enthusiasm and attitude toward the company. If the proper cooperation between producing manufacturers and distributing agencies were obtained, it would be possible to reduce the price of commodities placed on the market by utility organizations."

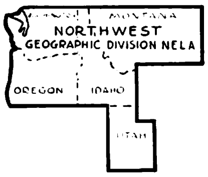
New officers were elected as follows: President, W. F. Ficklen, Charleston; first vice-president, C. H. Hardesty, Fairmont; second vice-president, F. M. Hawley, Bluefield; third vice-president, H. M. Cogan, Charleston. A Bliss McCrum was reelected secretary and B. M. Mohr, treasurer.

NORTHWEST ELECTRIC LIGHT & POWER ASSOCIATION

M. L. Hibbard, *President* **Berkeley Snow**, *Secretary*

Northwest News Letter

By Berkeley Snow



With Light's Golden Jubilee and the National Food Preservation Program behind us, interest is now centering on the more routine functions of association work—the studies undertaken by the standing committees and the preparation of reports based on these studies. In this geographic division committee work for the year, in so far as Accounting, Commercial and Engineering Section committees are concerned, is brought to a head at the so-called mid-winter conferences of these sections held generally in February and March.

Interest in these conferences this year is given additional impetus by reason of the fact that no general convention is to be held in this Division in 1930. The coming of the national convention to the Pacific Coast offers an excellent opportunity for Northwest companies to send larger delegations than it is possible to send to Atlantic City, and in order that energies and funds may be concentrated on the national event, the Division Executive Committee has resolved to omit a division convention this coming year. This action does not mean any diminution of effort on the part of committees, however. Rather will it have the opposite effect of stimulating effort, since it is most likely that larger delegations to the sectional conferences as well as to the national convention will be the outcome.

Two special studies of national importance are to be undertaken by the Engineering Section of this division during the current association year. Research on the causes of and remedies for radio interference from high tension insulators will be commenced by the Inductive Coordination Committee, headed by H. H. Schoolfield, chief engineer, Pacific Power & Light Company, Portland, Ore. This job was delegated to this division by the Engineering National Section and plans are well under way for the construction of a length of high line on which various tests may be carried out, from which it is hoped an effective and comparatively inexpensive method may be found for eliminating the trouble now experienced on existing lines. A location for the line on college property, and assistance in the experiments, have been offered by Oregon State College, Corvallis.

The second project is a continuation of the studies initiated some years ago on the possibility of controlling the movements of migratory fish, so important in the solution of the fish-and-dam problem. This study is to be carried on by the Fishways Subcommittee of the National Hydraulic Power Committee, composed entirely of Northwest engineers and chairmaned by J. E. Yates, assistant chief engineer, Pacific Power & Light Company, Portland. On the recent receipt of assurances from the U. S. Bureau of Fisheries that the Bureau would cooperate in any project deemed desirable by the committee, the committee is formulating plans for taking up experiments where they were left off last year.

Publications

Below are listed the committee reports or other material published during the past year, giving the publications in which they were printed and the prices of these publications.

The following reports were published in the Special Convention issue of *Electrical West,* May 15, 1929. If copies of this publication are desired, the enquirer should communicate direct with the McGraw-Hill Company of California, 883 Mission Street, San Francisco. If single or a few isolated reports from the list are desired, it might be possible to supply them from the extra copies remaining in the office of the secretary, 1208 Spalding Building, Portland, Ore., at the rate of 10c. per report.

GENERAL COMMITTEES

Educational Committee

The proceedings of the Sixth Annual General Meeting of the Engineering Section, at Walla Walla, Wash., March, 1929, containing all the prepared papers and the prepared and impromptu discussion on the subjects under consideration, are published in a separate booklet, extra copies of which are available at the office of the secretary at $1.50 each.

The Proceedings of the Twenty-Second Annual Convention, held at Seattle in June, 1929, are published in a separate booklet, copies of which are available at the office of the secretary at $1.50 each. In addition to reprinting all the committee reports listed as having been first published in *Electrical West,* the Convention proceedings contain also committee reports as follows:

Public Speaking Committee Report
Employees' Relations with the Public Committee Report
Review of Matters Pertaining to Public Policy in Oregon, by Geo. L. Myers

Talks and addresses delivered during the convention are also printed in the Proceedings.

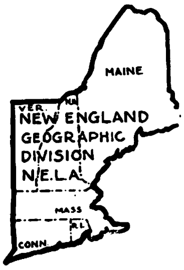
The address of the president, R. M. Boykin, delivered at the June convention, entitled, "Problems and Trends of the Electrical Industry in the Northwest," in pamphlet form may be had from the secretary at 10c. each, or in quantities of 25 or more at 5c. each.

NEW ENGLAND GEOGRAPHIC DIVISION

C. H. Hodskinson, *President* Miss O. A. Bursiel, *Secretary*

New England Activities

By O. A. Bursiel



The Public Relations Section held an interesting all-day meeting on November 14, at the Copley Plaza Hotel, Boston. The meeting was well attended and there were 232 at luncheon. The chairman of the Public Relations Section, L. D. Gibbs, opened the meeting with a brief but most inspiring talk on "Public Relations."

Creighton J. Hill, Babson Statistical Institute, Wellesley Hills, Massachusetts, addressed the gathering on "The Importance of Customer Ownership in Public Utility Development." Mr. Hill stated that he saw no reason why the extremely low market of the last few weeks should retard customer ownership in public utilities and reaffirmed the confidence of the Babson organization in the essential value of that ownership, asserting that the outlook is brighter today than it ever was.

Dr. Samuel W. Stratton, president, Massachusetts Institute of Technology, Cambridge, Mass., delivered an inspiring address on "Cooperation in Education." Dr. Stratton strongly advocated placing education and industry on a more cooperative basis, whereby industry, which is mainly dependent upon the trained graduates of educational institutions for its personnel, should bear its proportionate share of the expense involved in training college men.

Miss Mary Hopkins, director of training, Jordan Marsh Company, Boston, gave an interesting talk on "Public Contact Training of Employees." She stated it costs $75 to $100 to break in every new employee, and this means wise selection should be made.

Miss Sara Harris, chairman, National Women's Committee, chose for her topic, "Women in the Electrical Industry." "What is expected of the woman in business?" was the question raised by Miss Harris, and she answered it by saying that she had learned to expect just as much from the woman as from the man. She said there was no reason whatever for making any distinction between the two—that women are becoming generally recognized in business as equal to the male employee.

New England is manifesting much interest in the Employees' Public Speaking Contest and plans are now under way for the various company contests.

The Women's Committee, Miss Sue M. Carr, chairman, held its organization meeting on Oct. 22, with 100 per cent attendance.

Engineering Section

The Engineering Section, C. A. Mayo, chairman, is now fully organized and plans for the year are well under way.

The Hydraulic Power Committee, W. F. Uhl, chairman, held its first meeting at the Alden Hydraulic Laboratory, Chaffius, Mass., on Nov. 18. The members inspected the many interesting new models which have been developed and tested at the laboratory since the last meeting there, and Professor Allen of Worcester Polytechnic Institute showed them some of the models under test conditions.

The Accident Prevention Committee and Electrical Apparatus Committee have also held their organization meetings.

Commercial Section

The Power Committee, Thomas D. Bond, chairman, is active as usual, holding regular monthly meetings in conjunction with the New England Central Station Association of Power Engineers. At the last meeting of the committee held on Oct. 30, the following subcommittees made reports: Editing, Motor Characteristics, and Steam Utilization.

The Commercial and Industrial Lighting Committee, E. J. Broderick, chairman, held its first meeting on Nov. 15.

Accounting Section

The Customers' Records Committee, G. W. Rogers, chairman, has been very active, having held two meetings within the month at Headquarters. The committee, at its first meeting decided to consider the following subjects during the ensuing year:

1. Applications for service.
2. Consumer deposits.
3. Meter records.
4. Billing.
5. Collections.

Civic Development Committee

Chairman W. C. Bell held a meeting of the Civic Development Committee and plans were discussed for cooperating with the Massachusetts Tercentenary Committee in connection with its celebration in 1930.

General News

The Division's secretary, Miss O. A. Bursiel, addressed a gathering of Women's Club members at Wareham, Mass., on Nov. 20, having as subject "Electricity in the Home."

The Fifth New England Conference of the New England Council was held in Boston at the Hotel Statler on Nov. 21 and 22. A large number of the public utility executives of New England were present. The accredited delegates from the New England Division were Frank H. Golding, vice-president, Cambridge Electric Light Co., Cambridge, Mass., and David Daly, president, Blackstone Valley Gas & Electric Co., Pawtucket, R. I.

Publications

Copies of the Proceedings of the New England Industrial Electric Heating Conference held at Massachusetts Institute of Technology, Feb. 28 and March 1, 1929, are available at New England Division Headquarters, 1113 Statler Building, Boston, Mass., at 40 cents per copy.

GREAT LAKES GEOGRAPHIC DIVISION

G. C. Neff, *President* Tom C. Polk, *Secretary*

Great Lakes Notes

By Tom C Polk

WIS
GREAT LAKES
GEOGRAPHIC DIVISION
N.E.L.A.
MICH
IND.
ILL.

A conference of divisional delegates met at the Palmer House, Chicago, on Nov. 15 for a business session and luncheon. President G. C. Neff presided. Paul S. Clapp was also present at this meeting and gave an intimate picture of the work being done by the Association Headquarters staff. French Lick was named as the place for the annual 1930 convention, to be held on Sept. 25, 26 and 27.

The delegates voted to offer a divisional prize of $100 in cash, and expenses to the National Convention at San Francisco to the winner of the National Employees' Speaking Contest. The divisional elimination contest will be held the early part of May.

The Executive Committee was instructed by the delegates to make a study of state and divisional activities in the four States, with the thought in mind of coordinating all association work and eliminating duplication of effort.

Arrangements are being completed by the Women's Committee to hold a short course in home economics and demonstrations of gas and electric home appliances at Purdue University next March.

At a meeting in Chicago, Nov. 25, of a special committee of the Commercial Section, plans were made for the Electrical Advertising School and Merchandising Sales Conference to be held at the Chicago Edgewater Beach Hotel, Jan. 20, 21 and 22.

The customer Relations Committee will also hold a special meeting at that time.

On Nov. 11 and 12, at the Edgewater Beach Hotel, Chicago, George F. Oxley presided over an interesting meeting of the Public Information Bureau Directors and Publicity men. At a special after-dinner session, Messrs. John W. Lapham of the North Central Division, and C. M. Kilian of the Southeastern Division, delivered a barrage of new stories, with Thorne Browne acting as referee.

The division office has been moved to the Chicago Civic Opera Building, located at 20 North Wacker Drive. At least fifteen floors of the forty-six story building will be occupied by public utility companies and allied interests.

The Chicago Electric Club and Association will occupy two or three floors containing several dining and meeting rooms. In addition, there will be a lighting institute.

We hope N. E. L. A. members will feel free to use the facilities of our office. If you want to arrange for a meeting place, hotel or theater reservations, let us serve you.

The following convention reports and addresses have been printed by the Division. Copies may be secured from the secretary, 20 North Wacker Drive, Chicago.

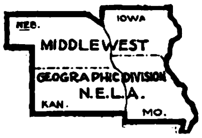
MIDDLE WEST GEOGRAPHIC DIVISION

A. E. Bettis, *President* **Thorne Browne**, *Managing Director*

Middle-West Activities

By Thorne Browne



During the month ending with this report, meetings were held by the executive committee of the Engineering Section, the Industrial Relations Committee, the Customer Relations Committee, the Educational Committee, the executive committee of the Commercial Section, the executive committee of the Accounting Section, and a conference was held between representatives of the Middle West Division Rural Electric Service Committee and the Rural Lines Committee of Iowa Section.

Engineering Meetings

The executive committee of the Engineering Section, all members present, met at Kansas City on October 30 and outlined the program for an all-day engineering conference to be held December 6. This is a meeting for engineers of the division in general. With agenda to guide it, each committee will meet separately for all-day round-table discussion. In the evening, following a dinner that will be in no sense a banquet, the various chairmen will outline the year's work planned for his committee and an address will be given by some engineer of prominence.

The Industrial Relations Committee, the Customer Relations Committee, and the Educational Committee have joint committee structure and by mutual agreement will hold all meetings jointly. The first of these was held at Kansas City on October 29, all members present. It was agreed to ask each member company in the division to furnish the name of the head of these activities for that company, and where no such organization exists, to urge the appointment of a responsible head. With these gentlemen the committee will contact, and approximately once a month will distribute service suggestions on the three lines of related activities for which the committee stands sponsor. The joint committee will also sponsor one meeting during the year in each of the States of the division for purposes of discussing the problems of these related activities and also to secure, as much as possible, similar meetings occasionally within the organization of each company.

Commercial

The executive committee of the Commercial Section, all members present, met at Omaha on November 20 to check up on progress in activities of this section, which have now run through a two-year period. It was agreed to specialize in preparing and distributing (a) an illustrated compendium of home service kitchen layouts and operating plans as exemplified in the division, these illustrations to represent different types applicable to different size towns; (b) an analysis of successful sales methods in use in the division and elsewhere for rural merchandising; (c) sales campaign plans for commercial cooking, industrial heating, and industrial lighting; (d) an illustrated compilation of merchandise stores plans, arrangement, description, and explanation of reasons for varying arrangements, these to be selected for the purpose of offering ideas on store displays applicable to different sizes of towns.

Accounting

The executive committee of the Accounting National Section met at Chicago on October 24 in conjunction with meeting of the Accounting National Section and checked over progress being made in carrying out the year's work outlined at a preceding meeting of the entire membership of the section.

Rural Service

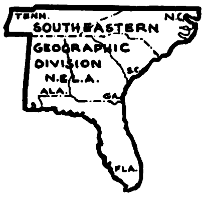
Chairman K. R. MacKinnon of the Rural Electric Service Committee of the division met with members of the Rural Lines Committee of Iowa Section at Des Moines on November 8 to plan the first of a series of rural conferences. It was agreed that the first conference should be held at Des Moines to discuss rural electrification problems, the meeting to be attended largely by representatives of Iowa companies. This conference is jointly sponsored by the Middle West Committee and Iowa Section Rural Committee.

SOUTHEASTERN GEOGRAPHIC DIVISION

T. H. Tutwiler, *President* **C. M. Kilian**, *Secretary*

Warm Breezes from the Southeast

By C. M. Kilian



Of particular interest to those present at the recent Engineering Section meeting of the Southeastern Division was the discussion on telephone protective equipment. The equipment of the Georgia Power Company and the Alabama Power Company was described in two interesting papers submitted by L. E. Anderson and B. F. Burch. A thorough study of telephone protective equipment is being inaugurated by the engineers of the Division. Copies of the papers mentioned may be had upon request to Southeastern Headquarters of the N. E. L. A., 207 Bona Allen Building, Atlanta, Ga.

Load Prognostication

An illustrated presentation of this subject by A. K. MacNaughton, Vice-Chairman of the Engineering Section and Electrical Engineer for the Georgia Power Company, elicited much favorable comment.

Mr. MacNaughton reported that after the study on Atlanta was complete, a check on general figures was made with telephone company engineers, and they were found to closely approximate each other.

Comment was made to the effect that in load forecasts of this nature, curves developed from one study could not be used from year to year without adjustment and without being brought up to date from time to time.

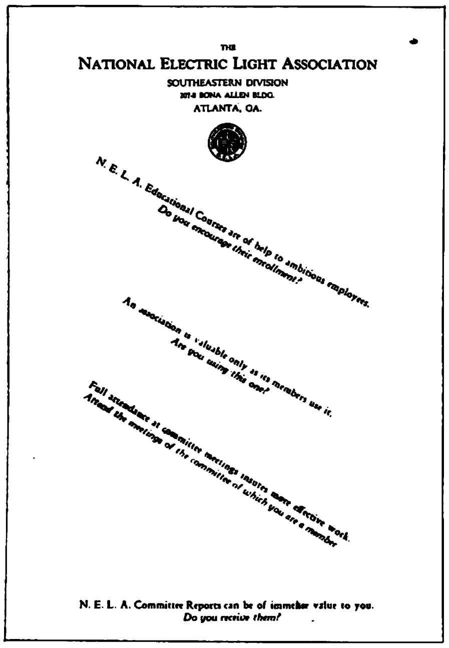
A general discussion developed the thought that a load survey of small towns for the purpose of forecast might lead to very inaccurate forecasts.

Study of Power Company Buildings Inaugurated

Lack of windows, too many windows, not enough doors, the wrong size doors, improper locations of entrances and exits, faulty roofs, inefficient steel sash, failure by contractors to follow specifications in construction, etc., etc., were a few of the things mentioned when the question, "What's wrong with our buildings?" was asked. A committee to study the subject has been appointed and will make a report.

Widespread Executive Support in Southeast

According to *Nela-Graph,* issued informally "Now and Then To Personalize the Southeastern Division," the



THE
NATIONAL ELECTRIC LIGHT ASSOCIATION
SOUTHEASTERN DIVISION
207-8 BONA ALLEN BLDG.
ATLANTA, GA.

N. E. L. A. Educational Courses are of help to ambitious employees.
Do you encourage their enrollment?

An association is valuable only as its members use it.
Are you using this one?

Full attendance at committee meetings insures more effective work.
Attend the meetings of the committee of which you are a member.

N. E. L. A. Committee Reports can be of immediate value to you.
Do you receive them?

Reduced letterhead of the Southeastern Division. The letterheads are printed with legends in various colors at the bottom. Three of the legends are reproduced diagonally across the face of this cut to indicate their range and variety. Mr. Kilian feels these comments are good reminders that the Association, to do the greatest good, needs the active cooperation of its members.

Southeastern Division has the executive support to the extent that every member company is represented in one or more activities of the Division.

Cities May Assess Property Owners for Ornamental Street Lighting in Alabama

Nela-Graph also reports, according to W. C. Allen, Lighting Engineer for the Birmingham Electric Company, that the Legislature of the State of Alabama has passed a bill authorizing cities of over 100,000 population to install ornamental street lighting and to assess abutting property owners for the cost of installation.

A copy of the bill may be had upon request to the Southeastern Division, N. E. L. A., 207 Bona Allen Building, Atlanta, Ga.

National Educational Committee Bulletin Designed

Impressed with the bulletin board posters used by the Division for promoting the N. E. L. A. Educational Courses, Fred R. Jenkins, Chairman of the National Committee, requested the division to submit layouts and copy for a national bulletin. This was done, with the result that the attractive poster, "The Common Roads are Always Crowded," is now being circulated nationally.

Necessity for Employee Education Stressed

Among the many things discussed at the meeting of the Public Relations Section, November 21, the subject of more systematic education of employees, the relation of their job to other jobs in the company, their relations to the customers with whom they come in contact, was the subject most thoroughly agreed upon.

It was the consensus of opinion of those present that the subject of the National Employees Speaking Contest was a most appropriate one for this purpose and as an additional incentive for participation in this contest divisional prizes have been arranged.

We plan to hold a series of employee meetings within the division at which the speaking contest will be presented with the thought of stimulating widespread interest.

Difference of Opinion on Public Relations

Because there was some divergence of opinion as to what constitutes a complete Public Relations department and its functions as regards other departments of the business, the Public Relations Section of this division plans to prepare an exhaustive report on the subject which, of course, will express an ideal to be achieved.

Economic Loss to Students Outlined

The subject of cooperation with engineering schools and the presentation of practical present-day problems of power company operation brought forth the opinion that students with only theoretical knowledge upon graduation were faced with an immediate economic loss due to their inability to apply such knowledge to practical problems.

With a view to assisting those engineering students who plan to enter the public utility business and who do not have the opportunity of practical experience alternating with their studies, it was decided to make a survey of existing plans and opinions as to their effectiveness and adaptability for application in the engineering classes of the Southeast. After this survey has been completed, a plan will be formulated for submission to engineering classes within the division along the lines in consonance with the policies of the higher educational institutions.

Publications

The following reports and papers have been reproduced by the division during the calendar year 1929 and may be secured from the secretary, 207-8 Bona Allen Building, Atlanta, Ga. The prices shown are for single copies only. Quantity prices will be quoted upon application. There is no charge for papers marked N/C.

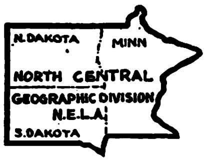
NORTH CENTRAL ELECTRICAL ASSOCIATION

Thomas T. Parker, *President* **John W. Lapham,** *Secretary*

North Central Notes

By John W. Lapham



The Women's Committee of the North Central Division held their annual meeting at the Nicollet Hotel, Minneapolis, Minn., on November 22-23, 1929, Mrs. Mabel H. Wilson, presiding.

A very interesting program was developed in the two day session. Several outside speakers were present. One of these speakers—Mrs. Ruth Carpenter, spoke on "the modern business woman." She stated that in her opinion two essentials of the modern business woman today were, first, a sense of humor and second, resourcefulness.

W. H. Brown, Safety Director, Northern States Power Co., Minneapolis, Minn., spoke on safety in the home, giving statistics which show that the greater number of accidents occurred there, and telling of the need for educational work in this field.

A particularly interesting feature of the meeting was the discussion on Home Service. This developed the idea that home service work was gradually increasing in most of the companies and that specific demonstration of electrical devices led to more sales. Those participating in this discussion were: Miss Ethel Stark, Minneapolis, Mrs. Lilly Smith, Duluth, Mrs. Alice Works, St. Paul, and Miss Leona Jantz, Sioux Falls, S. D.

Miss Vera Bauman of Huron, S. D., gave a very interesting discussion of the Middle West Utility Conference recently held at Biloxi, Miss.

T. D. Crocker, Northern States Power Co., Minneapolis, developed the subject of rates.

John Lapham, N. C. E. A., Minneapolis, gave a general discussion of electrical development.

One-half day was spent in the new Northern States Power Co. bungalow and the various lighting equipment in the rooms was explained by Miss Laurene Littel, Home Lighting Consultant.

The meeting was more largely attended than heretofore.

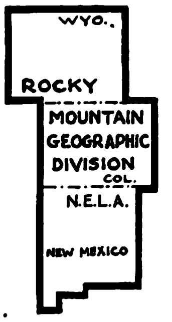
One hundred and ten high schools in the State of South Dakota are debating the following subject: "Should the State of South Dakota build and operate a Hydro-Electric Plant on the Missouri River?" This office, as well as N. E. L. A. Headquarters and local managers, has been besieged with requests for information on water power and public ownership.

ROCKY MOUNTAIN GEOGRAPHIC DIVISION

W. D. Johnston, *President* **O. A. Weller,** *Secretary*

Rocky Mountain News

By O. A. Weller



One of the oldest and best reputed newspapers of the Rocky Mountain Region has been known for over 50 years as the *Rocky Mountain News.* This monthly news letter of the Rocky Mountain Division, N. E. L. A., may therefore be assumed to be the youngest child of our local venerable newspaper.

In spite of constant snow in most of the Rocky Mountain States for a period of four weeks and abnormally low temperatures (all of which is very unusual) there has been a degree of enthusiasm and responsiveness in association work such as has not before been experienced in this geographic division. Every section and committee is fully organized. A program of work in each of the four major sections is now well outlined. The sessions of the several sections thus far held have been unusually well attended.

Commercial Activities

An illustration of the program of work will be found in the following subjects adopted for study by the commercial section:

Tabulation of Appliances as to Revenue Values, Load Factors, Demand, etc.

Electric Water Heater—Kind, Type, Efficiency.

Off-Peak Water Heating.

Oil Burners as Electric Load Builders.

Standardization and Stock Turnover.

How to Build Selling Campaigns; What to Sell; How to Sell It.

Promotional Rates in the Rocky Mountain States.

Street Lighting, Flood Lighting and Display Lighting as Load Builders.

Neon Sign with Power Factor Characteristics.

Public Relations

At a recent meeting of the Public Relations Section plans were developed for applying in local companies the report of the National Industrial Relations Committee covering the general topic of training employees for public contact work. Plans were promoted for the appointment of a key man in each company organization to study and apply the principles and suggestions incorporated in this report. Another activity was developed in connection with the Women's Committee work. It is proposed to create a group for the study of decorative lighting as a special means of employing the talents of the women of the industry in a field that is almost entirely unexplored. Public speaking work in the Rocky Mountain Region is being organized with the slogan "Facts Are Worth More Than Form." In other words, while our employees are studying the art of public address they will primarily devote themselves to a study of the facts of their own industry.

The National Employees Speaking Contest is receiving much attention in this geographic division. The following program has been adopted:

Months of November and December—Work of training groups and registration for contest.

Jan. 2—Final date for registration with the month of January for continued training and practice.

Month of February—Company elimination contests.

Month of March—State elimination contest.

April 24 and 25—Geographic Division elimination contest in connection with tri-state conference of Accounting and Public Relations Section.

In the city of Denver several employee study groups are now organized and under way with the prospect that more than 100 utility employees will be actively engaged in public speaking studies.

The Rocky Mountain Division due to budget limitations carries on all of its work through voluntary and part-time service of committeemen and association officers. From the standpoint of enthusiasm in the work and perhaps results achieved this is not detrimental. It is planned to extend the part-time administration of association affairs through a retainer basis. About this plan we shall have more to say in future issues of the *Rocky Mountain News.*

PACIFIC COAST ELECTRICAL ASSOCIATION

E. B. Criddle, *President* **Samuel H. Taylor**, *Secretary*

Pacific Coast Items

By Samuel H. Taylor

PACIFIC COAST
GEOGRAPHIC
DIVISION
N.E.L.A.
NEV
CAL
ARIZONA

It has been the customary practice of this Association, in the past, to confine the publication of committee reports, together with the activities of our Annual Convention, under one cover and the title of "Proceedings, Pacific Coast Electrical Association."

The current year we were enabled through the cooperation of our publishers, the McGraw-Hill Co. of California, to complete and distribute the proceedings to our membership within the 60-day period of time, following our convention held at the Hotel Del Monte, California, June 19 to 22, 1929.

In addition, during the past year two publications of considerable value, viz: "Agricultural Power Handbook" and a "Manual on Electric Air Heating," have been developed and individually published. The former is in loose leaf form, 8½ in. x 11 in. size pages. Repeated demands continue to reach this office for copies of the handbook from all portions of this country. The "Manual on Electric Air Heating" is in pamphlet form, 4 in. x 7 in. in size, and has been generously utilized by the member companies of this division in the development of air heating business.

There has been much thought and study given the subject of a change in our present publication methods. It has been thought advisable by many of our members to discontinue the publication of our annual proceedings, substituting therefor publication of our committee reports in like manner with the reports of the National Association.

Our Engineering Section has developed many interesting reports during past years, and no doubt will continue to do so in the future. These should be made available for such as are interested in a specific subject, rather than hidden away in a mass of pages of no interest to the great majority of our members.

Our sections and committees are organized and have each held a conference meeting, and will have like conferences in January, at which time we hope to be able to present something of interest as an incentive to our Eastern coworkers to spend a few days with us in San Francisco next June.

SOUTHWESTERN GEOGRAPHIC DIVISION

Fred W. Insull, *President* **S. J. Ballinger**, *Secretary*

Southwestern News Letter

By S. J. Ballinger

OKLA.
ARK.
MISS
SOUTHWESTERN
GEOGRAPHIC DIVISION
N.E.L.A.
LA
TEX

Tentatively scheduled for Jan. 7 to 11 inclusive, subject to change in dates if necessary in securing school facilities and instructors, the Southwestern Division has announced a School of Illumination to be established at Tulane University, New Orleans. P. E. McChesney, Chairman of the Commercial Section of the Southwestern Division, is in charge of the arrangements, and an advance program is being planned that will attract lighting experts from companies and manufacturers. Mr. McChesney is now in the East arranging for instructors and lecturers, and Tulane, which boasts of a splendid engineering school, is enthusiastic to inaugurate a School of Illumination. At this time it is probable that the school will especially feature home and store illumination, with lectures and courses on practically all other forms. Certificates will be presented to those who finish the prescribed course satisfactorily, and President Fred W. Insull of the Southwestern Division will preside at a banquet for this purpose on the last night of the school. Other prominent speakers, including J. G. Holtzclaw, Chairman of the Public Relations Section, will appear on the banquet program. This is the first School of Illumination in the Southwest, and, as far as we can learn, the first school established under the auspices of any division.

Short Course in Home Economics

The success which has attended the Short Course in Home Economics at Stillwater A & M College in Oklahoma, established by the Southwestern Division three years ago, has encouraged the executives to arrange for an additional course along similar lines to be established at Denton, Texas, where one of the State Teachers Colleges is located. The Stillwater course has won national recognition along with the Short Course at Ames, Iowa, and will be a permanent feature of activities in the Southwest. More than fifty girls attended the Short Course in 1929, and a larger number is expected to enroll in 1930. The establishment of a similar school at Denton will be especially attractive to member companies in the southern part of the division, and a large enrollment is expected from Texas and Louisiana.

Educational and Industrial Conference in Dallas

Arrangements are completed for an Educational and Industrial Conference to be held at the Baker Hotel, Dallas, Texas, Friday, December 6, immediately following an Executive Committee meeting scheduled for the same day. Homer Niesz, Chairman of the National Industrial Relations Committee, and Fred R. Jenkins, Chairman of the National Educational Committee, will be among the speakers on this occasion. The program calls for a general discussion of employee activities along many lines, and it is expected that such an exchange of thought will be beneficial to all companies in their industrial and educational work. Practically all of the larger companies of the Southwest are spending time and money on employee educational activities. Considerable time will be devoted to a discussion of Educational and Industrial Activities in the smaller communities.

Engineering Section Meeting

More than forty operating engineers in the electrical industry in the Southwest assembled at Fort Worth during November upon the call of the Engineering Section Chairman, R. F. Danner, to discuss engineering problems of particular interest to those in this territory. Among other things, it was decided at this meeting to discontinue the large Engineering Report that has been published in the past in this division, and publish the reports of each committee separately. Chairman Danner requested all reports to be in by the middle of March, at which time they will be passed upon by an Engineering Section Meeting and then referred to the Executive Committee.

Power Manual Wins Recognition Throughout United States

Among the many papers and reports prepared by the committees of the

Southwestern Division and presented at the 1929 Convention, was the Power Manual covering "Power Requirements, Power Costs, and Power Conservation," prepared by the Power Bureau of the Commercial Section. There has been a steadily increasing demand for these Manuals, and they can be secured from the secretary, Southwestern Geographic Division, in care of San Antonio Public Service Co., San Antonio, Texas, at a cost of $1.50 each.

Other Publications

Among other publications prepared by this division for the administrative year 1928-29 are the following:

Report of Accounting Section.
Report of Commercial Section.
Report of Engineering Section.
Report of Public Relations Section.
Report of Accident Prevention Committee.
Report of Civic Development Committee.
Report of Rural Electric Service Committee.
Report of Wiring Committee.
Report of the Women's Committee.

NEW MEMBER OF PUBLIC POLICY COMMITTEE

George H. Howard
President of the United Corporation and Chairman of the Executive Committee, Niagara & Hudson Power Corporation. Mr. Howard was elected to membership in the N. E. L. A. Public Policy Committee at the meeting held on Nov. 26.

RELATED and other ORGANIZATIONS

Conference of Public Utility Information Group

DISSEMINATION of information to the public was the main topic of a gathering of directors of public utility information bureaus, geographic division secretaries, and advertising, publicity and public relations men of the utility industry at the Edgewater Beach Hotel, Chicago, November 11th and 12th.

George F. Oxley, Director Department of Public Information, N E L A read a letter from Charles Gordon, Managing Director of the American Electric Railway Association, who was unable to be present, giving a general picture of conditions in the electric railway industry. This was followed by a similar presentation for the gas industry by B. J. Mullaney, newly elected president of the American Gas Association. Paul S. Clapp, Managing Director of the N E L A, spoke on the electric light and power industry.

The services of the three national associations were described in detail by Labert St. Clair of the American Electric Railway Association, Keith Clevenger of the American Gas Association, and Mr. Oxley of the N E L A. J. S. S. Richardson of the Joint Committee of National Utility Associations explained the publicity activities of that association.

On Monday evening, November 11th, at an informal dinner, J. F. Owens, a vice president of the N E L A and former chairman of the Public Relations National Section, spoke on the general subject of publicity, national conditions, including mergers, trend toward lower rates, etc.

B. J. Mullaney addressed the Tuesday morning session on the publicity and advertising methods of public utilities and this was followed by a general discussion.

Those present at the meetings were:

W. J. Baldwin, Clark Belden, James M. Bennett H. M. Blain, Jesse Blythe, C. W. Bradley, Arthur W. Brady, Thorne Browne, Joe Carmichael, Paul S. Clapp, Keith Clevenger, H. B. Converse, F. W. Crone, William H. Culver, Miss Isabell Davie, D. M. DeBard, William C. Edwards, Thomas F. English, E. Frank Gardiner, Joseph B. Groce, R. E. Haas, H. F. Herwig, W. H. Hodge, R. J. Holly, Harry E. Jordan, C. M. Kilian, George E. Lewis, John W. Lapham, H. M. Lytle, A. Bliss McCrum, R. R. McGregor, Edward F. McKay, S. T. MacQuarrie, Donald M. Mackie, Miss Sophia Malicki,

The 1930 Better Copy Contest

THE Public Utilities Advertising Association will again conduct a nationwide "Better Copy Contest." Contests held in previous years have been of unquestioned value in the stimulation of better copy in public utility advertising. This contest will give national recognition to outstanding public utility advertising.

The National Electric Light Association, the American Gas Association, the American Electric Railway Association, and the Advertising Federation of America have joined in cooperation for the success of this activity. In the past few years notable progress has been made by public utilities in the improvement of advertising production. Dealing as it does with the varied operations of public relations, securities, commercial and merchandising work, public utility advertising has a large responsibility. The contest is carried on for the purposes of maintaining high standards, awarding recognition to outstanding work and for providing all those associated in public utility advertising work with a collection of representative advertisements.

The contest is to be conducted in four separate divisions:

Electric Light and Power
Gas for the Home and Industry
Transportation
With a special award in the field of telephone advertising.

Beautiful trophies and certificates of award will be presented the three leaders in each division. The trophies, with certificates, will represent first place, and certificates for second and third places will be awarded in each division. Certificates for first place only will be awarded for telephone advertising.

The four national associations will make the awards jointly with the Public Utilities Advertising Association to the winners.

The judging of the winning advertisements in this contest will be done by a board of judges representing the managing directors and directors of advertising or public information departments of the four national associations, together with the chairman of P. U. A. A. Better Copy Committee judges will be: Paul S. Clapp, George F. Oxley, Alexander Forward, Keith Clevenger, Charles Gordon, L. D. Gibbs, Labert St. Clair, J. C. McQuiston, Herbert Metz, Earl Pearson, T. J. McManis, E. W. Swift.

The rules and conditions of the contest may be obtained from E. W. Swift, chairman, Better Copy Committee, Room 1035, 72 West Adams Street, Chicago, Ill.

WOMEN'S COMMITTEE

Miss Sara Harris, *Chairman* **Miss Isabell Davie**, *Secretary*

News Letter

By Mrs. Thelma Van Ness
Publicity Chairman

Miss Marie Reith, a member of the Contract and Inspection Department, The New York Edison Company, New York, has resigned to take a newly created position of Assistant Secretary of the Public Speaking Committee of the New York State Committee on Public Utility Information, and Secretary of the Women's Section of the Empire State Gas and Electric Association. In her new position, she will devote herself primarily to the study of methods in the training of women employees. Miss Reith was the pioneer in women's activities of the Association of Employees of The New York Edison Company, being Chairman of that Committee in 1925 and 1926. In 1927 and 1928, she served as Chairman of the Women's Section of the Empire State Gas and Electric Association.

* * *

According to *The Looking Glass,* reflecting the activities of The Electrical Women's Round Table, Inc., of Greater New York, this group was honored in having an Edison Pioneer, Major Wm. J. Hammer, as the speaker at their October meeting, celebrating Light's Golden Jubilee. Major Hammer was the builder of the first Edison Lighting Company plant in the world. Colonel Hill of the Jubilee Speakers' Committee also addressed the meeting.

* * *

In the September issue of *Memphis Tri-Service News,* Memphis Power & Light Co., Miss Helen Everts reported a very clever method of conducting a demonstration of the Prone Pressure Method of Resuscitation. These Tennessee girls held their Women's Committee meeting at the Shrine Pool and after several swimming and diving contests, a shriek from the shallow part of the pool drew a crowd to that spot. Miss Lucretia Tiffany rescued Miss Ruby Dunagan from a watery grave and placed her face downward on the floor. By that time, the girls realized they were witnessing a Prone Pressure Demonstration. Misses Eva Hood, Mildred Laughter, Lucretia Tiffany, Mabel Hall and Eloise Freeman took turns working on the victim, who gave an excellent imitation of a drowned person and allowed nearly fifteen minutes to elapse before she recovered. Besides the valuable instruction this demonstration imparted to the Committee, this group earned quite a few points in the Southeastern Division Contest, described in the News Letter in the October N. E. L. A. Bulletin.

"Exit Maid, Enter Madame" is the title of the prize-winning playlet, written by Miss Selma Cohn, in a recent contest held by the Memphis Power & Light Co. Formal presentation of the playlet was given at a Women's Committee luncheon at which company officials and their wives were the honored guests. There were eleven girls in the cast and Miss Cohn, the author, acted in the capacity of director. Another playlet, "Say It With Light," written by Miss Anne McLemore, was presented at a Women's Committee meeting. Miss Favo Montgomery is Chairman of this group.

The Women's Committee of the Nashville Railway and Light Co., of which Miss Cullie Clark is Chairman, recently held an essay contest in which Miss Marie Traylor won first prize on an article descriptive of the Nashville steam generating plant and distribution system.

Fourteen essays were written on the subject, "Loyalty" in a contest held by the Women's Committee of the Tennessee Electric Power Company. Miss Lena Grimm, Chairman of the Committee, was awarded first prize. The same group held an essay contest in September on "Light's Golden Jubilee."

The September issue of *The Nela Graph* included in its pages a Women's Section and the feature of these pages was a group of photographs of the five girls of the Southeastern Division who then stood highest in their respective states in the 1929-30 Divisional Contest.

* * *

The San Antonio (Texas) Public Service Company *Broadcaster* reports a very successful initial meeting of the Women's Committee for the season at which Mr. W. B. Tuttle, Company President and Honorary Chairman of the Committee, was one of the speakers. Mrs. Merribel G. Seele directs the activities of this Committee.

* * *

Iowa utility women held a conference in Des Moines in October, the purpose of which was to bring about a more complete organization of Iowa Women's Committees. The meeting was called by Miss Celeste Robinson, Chairman, and both Miss Isabell Davie of N E L A Headquarters and Miss Louise Hathaway, Chairman of the Middle West Division Women's Committee, were present.

The Des Moines Electric Light Company Women's Committee celebrated Light's Golden Jubilee at their October meeting. Mr. Talcott of the Sales Department spoke on Mr. Edison's life and inventions. A lamp campaign is in progress and the girls are demonstrating their ability to sell lamps and break their enviable record of last year.

* * *

The girls of the Madison Office of the Wisconsin Power & Light Co., devoted their September meeting to general consideration of programs for the year, Light's Golden Jubilee, Food Preservation and Lamp Contest activities. Miss Lillian Minch presided. The October program of the Chippewa Falls girls of the Northern States Power Company included a paper by one of the girls, Miss Frances Tarum, on "Chippewa & Flambeau Improvement Co.", a talk by Manager Smith on Light's Golden Jubilee, and a paper by Miss Lillian Wold on "Safety at Home, at Work and on the Street." Miss Florence Card and Miss Ruth Tarum reported on the Milwaukee Women's Conference and the State Contest.

* * *

The Wisconsin Public Service Corporation booth at the Northeastern Wisconsin Fair was one of the main attractions, as Misses Kathryn Heffernan and Zella Patterson, of the Home Service Department, were hostesses. A num-

MAGAZINE ARTICLES

Below is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

The American Home—December
Lighting the New House in an Old Way—Lurelle Guild
Lights and Shades—Janet Fox Wing
Gifts of Comfort for Both Sick and Well—Phoebe Cole

Good Housekeeping—December
Christmas Lighting — George W. Alder

People's Popular Monthly—December
Getting Acquainted with Your Waffle Iron—Mabel J. Stegner

Delineator—December
Remember the Useful Gifts
Christmas Trees in Your Garden—Ruth Dean

Electricity on the Farm—December

ber of prizes for baking were won by members of the Public Service cooking classes.

* * *

The October number of *Public Service,* published by the Northern Indiana Public Service Company at Hammond, printed a most interesting story by Miss Marion Eckman on her tour of Europe, as one of a group of thirty-five members of the Business and Professional Women's Club. Miss Eckman is secretary to Mr. Morse Dell Plain, vice-president of the company. Mr. Dell Plain was the speaker at the October meeting of the Hammond Women's Committee and his subject was the life of Thomas Edison. The attendance report showed one hundred and thirty-two employees, both men and women, present.

* * *

Recent activities of the Georgia Power Company Women's Committee are reported in *Snap-Shots,* the company publication. The year's program including study classes in first aid and the electric industry, was outlined at the first meeting of the Atlanta Committee in September. Miss Ruth Morris, chairman, who recently returned from a summer course at Columbia University, gave a brief report of her studies and explained her plans for the fall and winter.

* * *

Reports from St. Cloud, Faribault and Red Wing, Minnesota, were included in the September number of the Northern States Power Company publication. Mrs. Mabel Wilson, chairman of the North Central Division, is editor of the Women's Department. Miss Selina Swanson of the St. Cloud office has been elected vice-president of the local Business and Professional Women's Club. The Fairbault girls had a novel evening's entertainment at Wildwood, an amusement park. The Red Wing Committee held a meeting in Wabasha after having visited Alma, Nelson and Cochrane in the afternoon.

* * *

Alabama Power Company girls' activities are reported in *Power-grams,* with Miss Aileen Pierson, editor. At a recent meeting of the Birmingham Committee, Hugh White, of the Alabama Public Service Commission, was one of the speakers. His subject was "What the Public Expects of its Utilities."

* * *

Nebraska electrical women held a State conference at Omaha in October. Miss Alma Jane Hogue is the chairman of this section.

* * *

The State convention of the Kansas Section was held at Hutchinson in October. The outstanding women's activity was the round table, at which over fifty women were present representing the seventeen organized Women's Committees in Kansas. At this convention the girls presented the "Pageant of Light."

* * *

The October number of *Servicescope,* Kansas Gas and Electric Co. was edited by the Women's Committee. There are a number of articles written by the girls and one of the features of the publication is Miss Margaret Van Ness' double-page story of the photoplay, "Hot Shots" which was produced by the Wichita Women's Committee and photographed by Jack Lewis, in charge of Kansas Gas and Electric Company's Cinema Department. Members of the Women's Committee wrote "Hot Shots," edited it, wrote the titles and secured the properties. The plot tells the story of the transformation of the new employee in the utility office, U Tillie Tee, played by "Jack" Winterhalter, from a sophisticated, wise-cracking flapper into a sincere and enthusiastic young business woman.

* * *

Chairman Katherine Winkler of District M, Illinois Northern Utilities Company, reports that Misses Ruth Clark and Marion Allen of the Sterling office, gave a Prone Pressure Demonstration at a Lions Club meeting in October.

* * *

The fourth, quarterly, all-day meeting of the Illinois Northern Utilities Company Women's Committee at Dixon, took place on Oct. 21. The subject for discussion was the use of electricity and gas in the home in connection with cooking processes. Previous meetings stressed lighting, laundering and refrigeration. The principal speaker was Miss Katherine Holy, director, Home Service Department, Federal Electric Company, Chicago. Mrs. Maryan Gonnerman of the Dixon office assisted Miss Holy in her demonstrations. The meeting was in charge of Miss Edna J. Decker.

* * *

Miss Laura Hetherington of the Eastern Division, Oklahoma Gas and Electric Company, has won considerable fame as a window decorator. The clever and artistic displays that have been produced under her supervision have been photographed in order that her company might have a permanent record of these unusual windows.

* * *

Flashette is the title of the Nebraska Power Company Women's Committee bulletin, published at Omaha. Miss Lucille Hickey is the editor. An October issue announced the organization of a new Women's Committee in the Citizens Power & Light Co. territory with Miss Marion Headly holding the office of President. Miss Madeline Bohlsen of the Nebraska Power Company gave a lecture before the Home Mechanics Class at the Y. W. C. A. on the topic, "Care and Use of Electric Appliances in the Home."

* * *

A feature of the Women's Committee programs throughout the National Electric Power Company system was the pageant, "The Evolution of Lighting," according to *The Stimulator.* Lamp shade classes have been conducted by the Women's Committee of the Public Service Company of New Hampshire, under the direction of Miss Grace A. Phillips, company chairman, and Mrs. Marion C. Lander, State chairman. The members are given the materials with which to make the lamp shades and under Mrs. Lander's guidance they complete them within a certain period of time. Especially successful classes were held in Manchester in September and in Nashua, Keene and Laconia in October.

* * *

The Chatterbox is the name of the bulletin broadcasting the activities of the Tampa Electric Company Women's Committee in Florida, Mrs. Noma Jefferson, editor, and Mrs. Marguerite Roose, chairman. The girls of this group are busy with a tableau, "The Evolution of Lighting" to be presented at a meeting of the Tampa Electrical Benefit Association.

* * *

The Virginia Public Service Company Girls' Club activities are published in the company publication entitled, *The Office Crier.* This group held a luncheon meeting on Oct. 21 celebrating Light's Golden Jubilee, with all members present as well as a number of guests. These girls are busy in a stock sales contest.

* * *

The Women's Committee of Puget Sound Power & Light Co. holds weekly first aid classes. Miss Nell Marks and Mrs. Nell Laws of this company attended the Business & Professional Women's Club Birthday Banquet and Conference at the Hotel Vancouver, B. C., in September. They met there members of the Company Women's Committee from Bellingham, Mount Vernon and Bremerton. Miss Dorothy Chase, of the Bremerton office, is president of the Bremerton Business and Professional Women's Club. Members of the Seattle Women's Committee were responsible for the program at the local

Business and Professional Women's Club meeting on Oct. 22, celebrating Light's Golden Jubilee. Women's Committee members were invited.

* * *

Unusual recognition has been given Miss Mabel MacFerran, mathematical genius of the Southern California Edison Company. The story of Miss MacFerran's achievements, as reported in the Los Angeles *Examiner*, was mailed to all the stock holders of the company with their October dividend checks. This young woman, a full-fledged electrical engineer, with degrees from three universities, operates the system calculating board which reproduces the whole system in miniature. The Edison Company discovered Miss MacFerran after she had taken her third degree from the Department of Dr. Harris B. Ryan, famous electrical scientist of Stanford University. Before that she had been graduated from the Massachusetts Institute of Technology, specializing in physics, mathematics and electricity. Then she took a post-graduate course in high voltage research at Stanford and won the Elwell Fellowship that gave her the course with Dr. Ryan. Through her unusual ability and thorough knowledge of the fundamentals of electrical engineering and her marvelous grasp of its mathematics, Miss MacFerran steadily advanced to the position she holds today, the operating engineer's technical assistant.

Other news items from this company, as reported by Mrs. Jeanette I. Rees, chairman, include an appliance questionnaire upon which the girls worked in October. After being judged by a committee composed of a number of department heads, prizes were awarded at the November meeting, a feature of which was a demonstration of an electrically cooked dinner. The dinner itself was to be one of the prizes, a waffle iron and toaster to be the second and third prizes.

This committee is preparing for their annual doll contest to be held during Christmas. Ninety-six dolls have been distributed and will be turned in, dressed in accordance with the rules of the contest, by Nov. 30. Miss Nina Leonard is chairman of the Doll Committee. The dolls will be distributed at Christmas time to the needy children of the city.

* * *

The Women's Luncheon Club of the San Joaquin Light & Power Corp., at Fresno, Cal., celebrated Light's Golden Jubilee by joining the Ad Club and the Exchange Club in a noon luncheon at the Hotel Californian, Oct. 21, with Al Joy of the Power Company as the speaker.

Mrs. Anna Steese Richardson, director of the Good Citizenship Bureau of the *Woman's Home Companion,* was the incentive for a public meeting in the San Joaquin Light & Power Corporation Auditorium at Fresno recently. The subject of her address was "Whither Go Women?"

* * *

A feature of the last meeting of the Lincoln *Live Wires,* the Iowa-Nebraska Light & Power Co., was a talk on the proper use of the telephone by Miss Lula Rumery of the Lincoln Telephone Company. In connection with this an illustrated skit was presented by Misses Littie Hudson, Maurine Smith and Elsie Pierson. The plot was taken from an actual experience in the Order Department of the organization.

* * *

The September issue of *The Broadcaster,* of New Orleans Public Service, Inc., was edited by the girls. This is the second number published by the Women's Committee and is a magazine filled from cover to cover with interesting stories, articles and news items. Miss Julie Pailet of this company is the Southwestern Division Chairman and her efficiency contest is one of the outstanding activities of its kind.

* * *

The Middle West Division Women's Committee, of which Miss Louise Hathaway of the Iowa Railway & Light Co., Cedar Rapids, is chairman, has set up a seven-point program which is very interesting.

Miss Alma Jane Hogue is the Nebraska State Chairman. In her committee each member is responsible for certain territory, four girls acting as sponsors for the different companies in the specific district assigned to each.

Why Women in Our Industry?

By ALMA JANE HOGUE

President, Women's Division Nebraska Power Co.
Chairman, Women's Committee, Nebraska Section N. E. L. A.

I HAVE just enough what you might call "nerve" to believe that the electrical industry needs women employees. However, I will modify this somewhat by stating that the executives should not have us in their organizations if they don't have confidence in us and in our place in the industry. Since the women employees are in the industry, then why not get the most good out of them, that's why women's divisions were organized.

Women's divisions were organized also because executives realized that the women needed encouragement and stimulus. Women's divisions in our industry are not merely local organizations. National leaders have recognized this type of employees' organization as very important in developing the women employees as greater assets of our business.

All over America women's division organizations are springing up like mushrooms. Thousands of women employees of our industry are now receiving inspiration in becoming more valuable representatives of our public utility business. Right here in Nebraska, where at the present time we have only seven organized women's divisions, steps are being taken to organize six more, giving us a total of thirteen organized divisions in Nebraska.

These divisions aim not only to inspire women employees to more efficiency in the offices and other departments of their respective electric companies, but they aim to furnish these women employees with information so that they can discuss intelligently with the other women with whom they come in contact, the many, varied and intricate problems of our industry.

Once a famous politician said, "Give me fifty women who can spread information, and I will give you fifty newspapers." No one will deny that we women love to talk. That is why the women's divisions aim to furnish their members with proper information and inspiration so that the women can spend their time talking intelligently about the electrical business.

Not only does the women's division aim to make the women employees "good talkers" for our industry and our respective companies but it aims, also, to make us "good do-ers." It aims to inspire our women employees with loyalty, efficiency in daily duties, and elimination of waste both in time and materials.

Any women's division, given the proper opportunity of service and the proper supervision, can save in dollars for an electric company many times the amount expended for the operation of that division. Not only will it save dollars for the company, but it will give to the women employees more SENSE—the industry's sense of greater service to our customers.

The women of our industry have no fear that the men will hold them back. There is a definite place for women in our business, and with the proper encouragement and inspiration from the executives, the women cannot help but do their share in creating greater kilowatt-hour consumption and better public relations.

WHAT OCCURRED LAST MONTH

Agricultural

The standard rural electrification plan, which has been prepared by a Special Commission on Rural Electrification, has been accepted by a large number of the electric companies of Virginia. The plan standardizes the system under which rural communities and farms may make connections with power-lines at a reasonable cost. Under the plan, a minimum periodical rate for current is established for rural consumers.

* * *

The Public Service Commission of Georgia has issued an order cutting in half the cost to consumers of extensions of electric service into rural sections.

* * *

The Public Service Commission of the Province of Quebec, in cooperation with engineers of several of the largest hydro-electric companies, is making an intensive study of the problems of promoting the use of electrical energy on the farms of the province.

* * *

Colorado River Project

Senator Smoot of Utah has introduced a bill calling for construction by the Interior Department of a dam and power plant on the Green River in the Flaming Gorge of Horseshoe Canyon, Utah, at a cost of not more than $18,000,000. The project includes flood control, improved navigation and production of about 40,000 horsepower. An initial appropriation of $20,000 for surveys is included in the bill. Conditions similar to those of the Swing-Johnson bill requiring contracts for power to pay the cost of the project are included in the Smoot bill.

* * *

On November 9, Governor Dern of Utah issued a statement setting forth a protest against the sale of Boulder Dam power at 1.63 mills per kilowatt-hour, adopted by the Colorado River Commission of Utah at a meeting held with Governor Dern. The protest contends that the 1.63 mills rate would be less than competitive and holds that the cost of current should not control the selling price, except to the extent that it should be adequate to provide for repayment of costs, but the price should be controlled by competition. The protest further maintains that the charge of 25 cents per acre-foot for storage of water for the Metropolitan District of Southern California is too low. It is further declared that the price of 1.63 mills would injure the California market for Utah coal. The Utah Commission holds that there should be no government subsidy in fixing the price for current, but surplus earning should be spent for development of the resources of the entire Colorado Basin.

* * *

On November 12 the Colorado River Development Commission of Nevada submitted to Secretary Wilbur a bid for power to be developed at Boulder Dam. The Commission offers to take all of the "firm" power and says that it is prepared to install and operate the power-plants and to furnish satisfactory guarantees for proper financing. It offers a price of 1.75 instead of 1.63 mills per kilowatt-hour for "falling water." The Commission holds that Nevada is entitled to one-third of the power. It says that it does not want to appear to be seeking to acquire more than Nevada's rightful share, but bids for the whole amount in order to dissipate the theory that it is necessary to make any concessions to certain organizations or areas. Senator Oddie of Nevada has written to Secretary Wilbur in support of Nevada's claim.

* * *

Hearings on the proposed allocation of power to be generated at Boulder Dam were begun on November 12 at the Department of the Interior, with Secretary Wilbur presiding. Nevada was the only state represented at the November 12 hearing by a delegation, but a number of cities, towns and districts were represented. Written statements from those having protests against the proposed power-allocation were submitted. Protests in behalf of Nevada were voiced by Senators Pittman and Oddie. They claimed that Nevada should be granted one-third of the power developed and objected to having Nevada contract at the outset for all power that it would need in the future without authority to dispose of surplus power to companies of municipalities outside the state.

Representative Swing of California said that California should not be expected to carry the unused power of another state while such state was undergoing a development and then be required to permit such other state to regain the power later.

* * *

On November 13, W. B. Matthews, attorney for the Los Angeles Bureau of Power and Water, urged that transfer of authority over the operation of the Boulder Dam power project be made to the City of Los Angeles. He contended that if private corporations would not be satisfied with the power allocated to them without having a share in the operation of the plant, then Los Angeles and other districts and municipalities could use the entire output of the power developed by the Dam. Other representatives of Los Angeles spoke in a similar way.

* * *

At the November 14 hearing at the Department of the Interior, Senator King of Utah requested that Utah be allotted a share of the power generated at Boulder Dam up to 50,000 horsepower. L. Ward Bannister, representing Denver, stated at the same hearing that he had filed a statement on behalf of Denver requesting reallocation of power. In closing the hearings on November 14, Secretary Wilbur made a brief address appealing for agreement and cooperation.

* * *

The Southern California Edison Company has filed a written protest with the Secretary of the Interior against the proposed allotment of Boulder Dam current. The company claims that the tentative allotment is not in proportion to the needs of the applicants and says that it should be logically granted a larger proportion. Public Utility Companies supply more than four-fifths of the electric energy for the population and industries in the territory in question while municipal agencies supply less than one-fifth, the company's statement says.

* * *

A telegram from Secretary Wilbur to Governor Phillips of Arizona in regard to Arizona's protest concerning the allocation and price of Boulder Dam power says that the rate was fixed in accordance with the recommendations of electrical experts employed by the government and provides sufficient revenue to pay in 50 years for the dam and power house with interest and substantial yearly payment to both Arizona and Nevada. A reply sent by Governor Phillips declares that Arizona has always denied the validity of the Swing-Johnson bill, but hoped to arrange a compact with California and Nevada which would enable Arizona to accept the bill. Governor Phillip's reply also declares that the price fixed for power is not on a competitive basis and the price for storage of water for southern California is only nominal and noncompensatory.

* * *

Consolidations

The Associated Gas and Electric system has announced acquisition of the American Utilities Company, controlling properties valued at more than $10,000,000 in Missouri, Kentucky, Tennessee, Louisiana and eight other states.

* * *

Plans for consolidation of the Stanford Gas and Electric Company and the Connecticut Power Company, with combined assets of about $26,000,000 have been announced.

* * *

The United Gas Improvement Company has purchased the Commonwealth Utilities Corporation, the headquarters of which is in St. Louis.

* * *

The electric systems serving Port-au-Prince and Cap-Haitien, the principal cities of Haiti, have been added to the system of the Southern Cities Utilities Company which, a few months ago, acquired the public utilities formerly operated by the Dominican Republic.

* * *

A report from Rockville, Connecticut, says that control of the Rockville-Willimantic Lighting Company has passed to the Connecticut Electric Service Company.

* * *

The Utilities Power and Light Corporation has made formal application to the Missouri Public Service Commission for permission to acquire additional stock of the Laclede Power & Light and Laclede Gas Light Companies which operate in St. Louis and vicinity.

* * *

Acquisition of a controlling interest in the Columbus, Indiana Gas Light Company by the Midland United Company, an Insull holding company, has been announced.

* * *

The Utilities Power and Light Corporation of Chicago has purchased the Suburban Light and Power Company of Alliance, Ohio.

* * *

The Alabama Power Company announces the purchase of properties of the Gulf Utilities Company, located in a number of small cities in Alabama.

* * *

Earnings of Utilities

The Department of Commerce announces that an increase of 17.5% in gross earnings of public utility enterprises, exclusive of telephone and telegraph companies, is reported for the first eight months of 1929, as compared with 1928. For the period covered in 1929, 95 companies operating gas, electric, heat, power, transportation and water services, report earnings of $651,500,000 as compared with $554,432,512 for 1928.

* * *

Foreign

The Amtorg Trading Corporation, controlled by the Soviet Government, announces that an increase of 403,500 kilowatts in the capacity of power plants in Russia is contemplated during the coming year. Of this 223,000 kilowatts will be generated in new plants to be completed during the year and the remainder will be accounted for by expansion of existing plants.

* * *

Hydro-Electric

The Oklahoma Commission on Drainage and Irrigation has granted to the Grand Hydro Corporation a permit to develop a hydro-electric plant on the Grand River in northwestern Oklahoma, capable of producing 40,000 horsepower.

* * *

A commission of three engineers and three geologists has been appointed by the State Engineer of California to investigate the safety of the San Gabriel Dam, which is being constructed by the Los Angeles County Flood-Control District. Work on the dam, whose ultimate cost is estimated at $25,000,000, was stopped when adverse reports about the foundation were made by geologists.

* * *

The Federal Power Commission on October 30 and 31 and November 6 continued its hearing on applications for development of hydro-electric power on the Flathead site in Montana. The Rocky Mountain Power Company, subsidiary of the Montana Power Company, and Walter H. Wheeler, a Minneapolis engineer, are the applicants.

* * *

The Pacific Gas & Electric Company is building at Salt Springs on the Mokelumne River, near Sacramento, what is said to be the largest rock-fill dam in the world. When completed, it will be 330 feet high with a crest length of 1,300 feet, a base width of 960 feet, and will contain 3,000,000 cubic yards of granite quarried near the site. It is expected to produce 33,500 horsepower. This is the first unit of a $25,000,000 program of hydro-electric development being put through by the company.

* * *

The Federal Power Commission has authorized a license to Hyrum City, Utah, for an $80,000 power and light project in Blacksmith Fork Canyon. The California-Oregon Power Company of San Francisco has applied to the Federal Power Commission for a license to construct a dam on Rogue River, near Gold Hill, Oregon, which would have a capacity of about 1,600 horsepower.

* * *

At the last session of the Nebraska Legislature a Commission was created to find locations for dams for flood control and creation of hydro-electric power. The Commission appointed engineers to investigate, and these have reported three advantageous dam sites on the North Platte River.

The Safe Harbor Water Power Corporation has let the contract for construction of the dam and power house of the great hydro-electric development at Safe Harbor on the Susquehanna. The first installation will be about 230,000 horsepower.

* * *

The Federal Power Commission is making an economic survey of the need for electrical power in Washington, D. C, and vicinity in the course of preparing for Congress its report on the applications for preliminary permits to examine the possibilities of power-development at Great Falls on the Potomac.

* * *

The annual report of the Federal Power Commission was issued on Nov. 25. It discloses that 1929 will set a new high record for production of electric current and forecasts continued expansion of the electrical industry. The report says that during the past ten years the proportion of the country's electric energy requirements generated from water power has fluctuated between 34 and 40 per cent of the total, with no definite trend toward either steam or hydro-electric production indicated for 1929, on account of the drought, the percentage of current generated by water power has been largely reduced.

The report questions that the purpose of the Federal Water Power Act has been fully achieved in view of the fact that water resources have not been as rapidly developed as they might have been. It declares that the commission favors State rather than federal control of utilities. On the Colorado Basin situation, the report indicates that some applications for power development not interfering with the Boulder Dam project may soon be taken up.

* * *

A license to the Sierra and San Francisco Power Company for a project on the Stanislaus River, Cal., has been granted by the Federal Power Commission. The plant will have an average annual output of 113,000,000 kwh.

* * *

Municipal Plants

A survey just completed by the Nebraska Public Utilities Bureau shows an increase in the trend away from municipal ownership and operation of electric plants. During the year ended October 1, 1929, 48 plants were purchased by the interconnected systems, 40 of them from municipalities, and in practically every case a substantial reduction in rates followed.

* * *

On October 22, the people of Junction City, Kansas, defeated a proposition to issue $425,000 in bonds for the building of a municipally-owned electric plant.

Rates

The Keystone Public Service Company, of Oil City, Pennsylvania, has announced reductions in residential rates in Oil City, Franklin, Titusville and surrounding territory. The annual saving to consumers will be $41,000.

* * *

The Mississippi Power Company, which serves about 150 towns, announces a rate reduction of about 8 per cent on electricity used for lighting and other ordinary purposes. This means an annual saving to consumers of between $200,000 and $250,000.

* * *

The City of La Grange, Georgia, announces lower electric and water rates to customers of the municipal plants.

* * *

A new schedule of rates announced by the Bureau of Water and Power of Los Angeles, reducing charges to consumers by about $1,100,000 a year, has been approved by the Los Angeles City Council through passage of an ordinance. The Los Angeles Gas and Electric Corporation announces a corresponding reduction in rates which will amount to $800,000 per year. The new rates will become effective on January 1.

* * *

The United Electric Light Company of Springfield, Mass., has announced a new rate schedule for the use of electricity by stores, which will mean a saving of $35,000 a year.

* * *

The Public Service Commission of Georgia has announced a new schedule of commercial rates for the Georgia Power Company applicable in Atlanta and 228 cities and communities. The rates become effective with the meter readings of December. They will result in both increases and decreases to individual customers, but are to be applied universally to all customers of the company taking the same class of service throughout the state, and will result in an aggregate decrease in revenues of more than $200,000 annually.

* * *

The Pacific Gas & Electric Company and the Western Electric Company on Nov. 7 filed with the California Railroad Commission a voluntary reduction of rates.

* * *

The Mountain States Power Company of Albany, Ore., has reduced commercial and residential rates to the amount of $30,000 annually.

* * *

Regulation

On Nov. 8 the United States Senate adopted a resolution directing the Federal Trade Commission to investigate and report to the Senate the amount of interstate transmission of electrical power, whether transmitted between the same or different companies, the names of the concerns and the relation between the amount of electrical energy consumed in a State and the amount produced therein. Senator Couzens, Chairman of the Senate Committee on Interstate Commerce, and author of the bill proposing a Federal Commission on Communications and Power, introduced the resolution.

The Public Utilities Commission of Connecticut has adopted a resolution opposing the Couzens bill which provides for a Federal Commission on Communications and Power.

* * *

The Public Utilities Commission of Colorado and the Railroad Commission of Kentucky, which occupies about the same position in Kentucky as Public Service Commissions in some other States, have adopted resolutions against the Couzens bill.

* * *

The Board of Railway Commissioners and, ex-officio, the Public Service Commission of Montana have adopted a resolution opposing the Couzens Bill. Mention is made in the resolution of similar opposition expressed in a resolution adopted by the National Association of Railroad and Utilities Commissioners.

* * *

The Supreme Court of New Jersey, on Nov. 15, handed down a decision sustaining the right of a public utility to refuse to furnish electric current to the owner of an apartment house to a master meter for resale to tenants for the profit of the apartment owners or the meter company.

* * *

The Federal Trade Commission announced on Nov. 20, that, as a result of the resolution passed by the Senate, it would immediately undertake inquiries into the interstate transmission of electrical current.

Amplifier Talks

(*Continued from page* 768)

20 years ago, these new classes of engineers have an infinitely better training, more thorough knowledge and wider views. This fact alone is sufficient guarantee of future progress and still further improvements."

Expanding on this subject enthusiastically, he said: "The United States of America and its business interests have acquired through the war, more rapidly than would have otherwise been possible, a tremendous wealth which allows them to deal not only with their own national, financial, commercial and political problems, but which induces them to have and to defend foreign interests. This means to me that the States, being one of the world's leading nations, must lead not only through money and material power, but in an intellectual way as well. To do this, your nation needs an army of well schooled and finely educated men. A serious improvement and a great step forward can easily be recognized by those who compare today with 18 years ago. The road of educational and social matters which you have been traveling is a splendid one, and I am sure you will keep to it with constantly increasing effort. A great nation needs many finely bred, well trained, highly educated men, and the more there are the more easy will be the accomplishment of your tasks."

Speaking of the difficulties which many scientists often encounter because of the fact that they are faced with the necessity of solving the problems of the material requirements of living, he said: "A nation as rich as the United States owes it to itself to help in research work. The efforts made in this respect by the great electrical and chemical manufacturing companies are certainly remarkable, but I am pleased to note that you are going further—that the President of the United States, Mr. Hoover, in recognition of this necessity, has promoted the creation of a Research Fund which will provide an annual income of at least two million dollars to establish National Research Professorships and in other ways to cooperate with universities and other institutions which are prepared to do their full share in the encouragement and support of fundamental research in the mathematical, physical and biological science. This news is the more pleasant when one learns that the light and power companies are supplying two million dollars to this fund and the electrical manufacturing companies another million."

Apparently the present E. O. Meyer, successor to the young idealist of twenty years ago, has not been "disenchanted." One might express the wish that more distinguished guests from the other side of the Atlantic would approach the United States with such an open mind and would make use of the time they may spend here as intelligently. Visits by men of this high calibre cannot help but advance the cause of international cooperation as well as a very real and lasting friendship between two such nations as France and America.

LEGAL DECISIONS from RATE RESEARCH

EDITOR'S NOTE: The N. E. L. A. BULLETIN carries each month brief comments on some of the leading cases reported by *Rate Research* as coming before either State or Federal courts or Public Service Commissions.

Indeterminate Permit Invalid in Oklahoma

THE Constitution of the State of Oklahoma contains about 400 paragraphs and occupies at least 100 printed pages. A great many matters generally provided for by statute in other States are part of this constitution—unchangeable except by constitutional amendment.

In 1925 the Oklahoma legislature passed an act providing for the surrender of limited term franchises and the taking out of indeterminate permits of a somewhat qualified nature in lieu thereof, and also providing for certificates of convenience and necessity. The legality of the law was at once challenged under the Oklahoma Constitution and has now been held invalid by the Supreme Court of that State in the case of Okmulgee v. Oklahoma Natural Gas Corporation (*Rate Research,* vol 35).

Constitutional Provisions in Oklahoma

A number of constitutional provisions were discussed in connection with the validity of this act, such as the initiative and referendum; the provision against construction and operation of a street railroad without consent of the local authorities: but the ones upon which the decision turned were those providing that no municipal corporation should ever grant, extend or renew a franchise without the approval of the majority of qualified electors within the corporate limits; the provision inhibiting exclusive franchises; and section 5A, article 18, which provides that "no franchise shall be granted, extended or renewed for a longer term than 25 years."

It was claimed that while these provisions might be limitations upon the power of the municipality they were not limitations upon the power or authority of the legislature in the matter of granting franchises. The Supreme Court held they were limitations upon the legislature as well as upon the municipalities and hence the indeterminate permit law was invalid.

It must be remembered that the Constitution of Oklahoma was adopted in 1907, the year in which State regulation of utilities in its present form had its inception in the States of New York and Wisconsin. The economic principles underlying regulation were then not generally understood, and the bearing of short term franchises on such regulation and public welfare but little appreciated. Although the indeterminate permit law had its origin in Wisconsin in 1907 it was not until several years after that the nature of such a franchise was understood and, as a matter of fact, the merits of the indeterminate permit have only in recent years been fully appreciated. Yet the Oklahoma Constitution adopted over 20 years ago inhibits a form of franchise the merits of which are generally conceded by all serious students of economics.

The decision does not in and of itself pass upon the merits of the indeterminate franchise and expressly refrains from passing upon the policy of providing for indeterminate permits. The opinion, which is lengthy, is devoted to a discussion of the applicability of the various constitutional provisions in Oklahoma to the legislative act of 1925.

The decision, therefore, while very important within the State of Oklahoma, is perhaps most important as an illustration of the disadvantages of covering matters not fundamental by rigid constitutional provisions which generally might better be left to the wisdom of legislative enactment so that the legislature can act wisely from time to time as changed conditions and experience warrant.

The constitutions of one or two other States provide for a 20 or 25 year limitation upon franchises, but generally such provisions, where they now exist, are legislative and may be repealed by the State legislatures. Even in the one or two cases where such limitations are found in the constitutions, it does not follow that the construction of the Oklahoma Constitution would be applicable.

Municipal Business Proprietorship

THE Supreme Court of Oregon, in holding that a city was authorized to sell electric energy outside its limits and that a State statute excepting municipally owned utilities from regulation by the public service commission was not unconstitutional, upon rehearing said among other things: "Much of the brief is taken up with discussion of the economic results that would follow an adherence to our original opinion and to a certain extent we agree with counsel in the view that participation by the municipalities in enterprises such as furnishing water or electric lighting outside of its municipal limits is not in accord with sound economics or public policy, but states and municipalities often engage in activities which, while not prohibited by their constitutions or charters, are unsound and sometimes disastrous" (35 *Rate Research* 309).

Free Service to City Officers

THE City of Roswell, N. M., owns its own water works plant and has been giving free service to the officials of that city. In a recent decision by the Supreme Court of that State (35 *Rate Research* 339) the Supreme Court held that such practice was illegal.

An interesting part of the decision is that it was not based upon any specific statute but upon general principles. The city claimed the right to do what it pleased with the water, but the Supreme Court held that the city was a trustee for the inhabitants and could not make a gift of city property unless it could show authority in law.

Revenues from Merchandise Part of Utility's Income

THE California Railroad Commission in ascertaining the return on the value of a utility property, has just ruled that miscellaneous jobbing and merchandising revenues should be considered as part of the operating income in a rate proceeding. Among other things the commission said: "The same quarters and the same employees are used to carry on this branch of the business; it is a mere incident of the business and is used to attract business; and the expense of conducting it are largely absorbed in various operating expense accounts. It is neither practicable nor reasonable to set this activity of the utility off by itself" (35 *Rate Research* 323).

Eminent Domain

IT is a well understood principle of law that the power of eminent domain does not extend beyond the State limits and cannot be used solely for the benefit of another State.

United States District Court for the Northern District of Indiana holds that the power of eminent domain can be exercised within that State although the purpose thereof may be also to make electricity available in another State. "It should also be kept in mind that this right to condemn will not be refused merely because the peoples and communities of another State will be likewise benefited" (35 *Rate Research* 329).

Rate of Return

United States District Court for the Western District of Kentucky has ruled that any return less than 8 per cent would not be fair and reasonable. (35 *Rate Research* 312).

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given

Domestic Rates Steadily Decreasing

ACCORDING to the statistics for the electric light and power industry, issued for September by the Statistical Research Department of the National Electric Light Association, the downward trend of the average price of domestic electric service is steadily continuing.

Taking the United States as a whole, the average for the twelve months ending with Sept. 30 was 6.30 cents per kw-hr. This compares with an average of 6.40 cents for the period ending with June 30 with 6.50 cents for the period ending with March 31 and with 6.55 cents for the calendar year of 1928.

According to the present trends, the final average for the whole year of 1929 will be in the neighborhood of 6.2 cents per kw-hr., a decrease of more than five per cent during the year.

Coincidently with this progressive decline in the average rates, the amount of electricity used by the average customer has shown a steady increase. During the twelve months ending with Sept. 30 the average for the United States as a whole was 487 kw-hr., as compared with 459 for the calendar year of 1928. For the entire year of 1929, present trends indicate an annual use of 500 kw-hr.; an increase of 41 units per consumer, or of nearly nine per cent over 1928.

The Guest Is Amazed

THE Missouri *Utility News* says that a guest at a recent demonstration illustrating laboratory achievements by electric and telephone engineers was amazed when:

He "heard" a picture of President Herbert Hoover.

He heard a speechless man "speak."

He saw a deaf man "hear."

He heard the power of 500,000 times 50 strong-lunged men's voices shout the words of one man.

He heard his muscles move, with a sound like thunder.

He telephoned his photograph.

He learned it is possible to gaze at a scene many miles distant.

He heard speech "scrambled" as a cook scrambles eggs.

He heard the top third, bottom third and center third of a strain of music.

He danced to "upside down" music and heard speech "upside down" and "right side up" at the same time.

He was looked over by an electric eye.

He saw and heard speech "take a rest" on the route from lip to ear.

He talked into a telephone and then walked over to the other end of the line and listened to his own words four seconds after speaking them.

He heard the music continue after a phonograph record had stopped playing.

"Such is modern progress," says the *Utility News.* "Many of these things may be commercially perfected within a comparatively short time. Indeed, it may be possible for us to sit in our homes and enjoy some of these remarkable developments a few years from now."

Mr. Vanderbilt and Mr. Edison

THE New York *Herald Tribune* recently published an amusing story concerning the first electric meter constructed by Mr. Edison. It seems that in the early stages of electric lighting, Cornelius Vanderbilt was among the first to have his house wired. The service charge for lighting in those days was based entirely on the number of lamps installed and not in terms of the actual amount of energy consumed. Mr. Vanderbilt did not think this was fair, and, sending for Mr. Edison, he poured forth his woes. The conversation, according to the *Herald Tribune* was as follows:

"I believe that I am being overcharged for the amount of electricity that I use," ventured Mr. Vanderbilt.

"How so?" asked Mr. Edison.

"Why you charge solely on the basis of the number of lamps that I had installed and I rarely have more than half of them turned on at any one time. Besides, I don't see how you can tell how many hours I have had any of them burning."

"Quite so; but suppose I install an apparatus that will tell me how many lamps you have used and how long they have been burning?"

"Impossible," retorted Mr. Vanderbilt.

"We'll, I'll make a wager with you," persisted Mr. Edison. "I'll bet at the end of next month I will be able to tell you the number of lamp hours of electricity you have used."

The wager was made and Mr. Edison devised the first convenient electric light meter, which made use of the deposition of copper on a plate. The plate was weighed before the test and then again after the test. The difference in weight was determined, and, knowing the electro-chemical equivalent of copper, the amount of electrical energy consumed could be accurately calculated.

Mr. Vanderbilt instructed all of the servants in his house to keep a careful check on how long each lamp was burned. He was quite shocked when he discovered that both results were almost identical.

Moonlighting

"MOONLIGHTING," a new development in the science of illumination, has been introduced in lighting the exterior of the new Museum of Fine Arts in Cleveland. It differs from the usual floodlighting of buildings in that the light intensity is but little brighter than the light from a bright full noon, or about the equivalent of a clear moonlight as seen in the rare atmosphere of the southwest.

"This moonlight is just the proper intensity to harmonize with the refined architecture of the museum, and it lends that quiet repose and dignity desired in the surroundings of buildings of this character," says J. W. Gosling, of the General Electric Company. "A picture in reality, like the setting on a great stage, it is really one of the most charming sights, from an artistic point of view, that I have ever seen." (*See Frontispiece.*)

Steel Sound Recorder for Movies

THE recording and reproduction of sound on steel by electromagnetism is the latest product of the laboratories of the talking motion picture industry, according to the *Electrical Times* (London). It is known as the Blattnerphone and is now being demonstrated at the studios of the Blattner Picture Corporation at Elstree.

The Blattnerphone is the application of electro-magnetic control to the talking film. Instead of a disc or film strip, steel tape is used, on which the sound is recorded. The recording is "positive," so that the tape can be used immediately for reproduction or for the making of an unlimited number of copies. It is stated that this steel tape is practically invulnerable; that it may be handled and transported, and can be passed through the machine a thousand times without developing wear or disturbing noises. It is also claimed that in comparison with the "sound-on-strip" method, the cost is less than one-fiftieth for the same time duration of recording and reproducing.

THE REVIEWING STAND

See News Letters from Geographic Divisions in "Geographic Divisions and State Associations" section for listing of publications of the several divisions during the year.

Interstate Transfer of Electric Power in 1928

N. E. L. A. Pub. No. 019. Statistical Bulletin No. 4 of Statistical Research Department N. E. L. A., 8 pp.

THIS study shows that 89.27 per cent of the total electric power consumed in the United States in 1928 was produced within the State of consumption, and consequently did not cross State lines.

The remainder, or 10.73 per cent, of power consumed crossed State lines on its way to market and is consequently involved in interstate movement.

Approximately two-thirds of the interstate power arises from the operation of thirty major generating plants separated from their normal power markets by State lines because of economic consideration or location of waterfalls. Such plants are the Conowingo, Keokuk, Cahokia, Holtwood, etc.

Analysis has been made of the 10.73 per cent of electric power crossing State lines from the standpoint of regulation.

Two-thirds of all interstate power, or 6.62 per cent, of power consumed, designated as "Direct Distribution," is power generated in one State and distributed to consumers in another State by the same company. The rates at which this power is sold to consumers are now within the jurisdiction of the State and will remain so unless and until the Federal government exerts its superior authority.

The remaining 4.11 per cent of total power consumed, designated as "Wholesale Transactions," is generated in one State and sold to another company in another State for distribution. These transactions are exclusively within Federal jurisdiction so far as concerns the direct regulation of the wholesale rate, although the rates which may be charged the ultimate consumer are subject to control by State authority.

The relative proportion of power in interstate movement to total consumption has increased from 8.99 per cent in 1926 (Harvard Study) to 10.73 per cent in 1928. Practically all of this increase has been due to the placing into operation of three major developments during this time—Conowingo, Md.; Bellows Fall, Vt., and Sterlington, La.

The study indicates that the distance traversed by the average kilowatt-hour in its path from power house to customer in the United States is only about 22 miles. If the long-distance bulk transmissions of the Pacific Coast are excluded, the average distance traversed is only 18 miles.—*P. S. C.*

Operating Methods Overhead and Underground Primary and Secondary Distribution Systems

Report, Overhead Systems Committee, N. E. L. A. Publication No. 03, 24pp. (illustrated). Price, 40 cents; to members, 25 cents.

THE best practice in operating methods of overhead and underground primary and secondary distribution systems is given in this report. The data are based on replies to two comprehensive questionnaires: the first dealing with operation of the overhead distribution feeders, including primary and secondary systems and transformers; and the second questionnaire on the operation of the underground distribution feeders, also including primary and secondary systems and transformers. All figures and conclusions relative to underground practice are based on the analysis of communications received from 31 operating companies. Data on the overhead distribution systems are based on replies of 39 companies.—*E. S. B.*

Cable Installation

Report, Underground Systems Committee, N. E. L. A. Publication No. 02, 16pp. (illustrated). Price, 30 cents; to members, 20 cents.

VARIOUS methods of installing cable in underground conduit systems in suburban sections with reduced capital expenditures are outlined. New practices or equipment used in underground cable and additional information on duct lubrication and pulling stresses are included.

Cable reel standards, as adopted by the Insulated Power Cable Engineers Association and approved by the Underground Systems Committee is given for reference, as is also a summary of reports from member companies on the reuse of withdrawn cable.—*E. S. B.*

Casualty Insurance for Gas and Electric Utilities

Report, Insurance Committee, N. E. L. A.* Publication No. 016, 12pp. Price, 25 cents; to members, 15 cents.

CASUALTY Insurance is treated as it affords indemnity against

1. Direct loss or damage to property.
2. Liability for claims for death or personal injury.
3. Damage to property of others, resulting from accidents or casualties.

Principal policy forms of interest to public utilities which protect against claims made upon the assured because of his legal liability are outlined and discussed. Examples of forms of insurance which usually cover both direct loss to the assured and his liability to others, are included along with other forms of casualty insurance which usually only cover direct loss and damage to the property of the assured. A bibliography on casualty insurance concludes the report.—*E. S. B.*

---

*Prepared in cooperation with Insurance Committee, American Gas Association.

Report of Insurance Committee A. G. A. 1929

Copies of this report may be procured through the N. E. L. A. Insurance Committee, from the Sales and Order Department of N. E. L. A. Headquarters or directly from the American Gas Association, 420 Lexington Avenue, New York.

THE Insurance Committee of the National Electric Light Association invites attention to the 1929 Report of the Insurance Committee of the American Gas Association with the thought that it contains many ideas and suggestions which may be useful to electricity supply companies.

The A.G.A. report contains the latest information on such items as insurance on deferred payments on merchandise, the 90-day limited automatic clause, the inherent explosion clause, and other matters of current interest. It also contains among other recommendations the Report of the Insurance Records Subcommittee which should be directly useful to the Accounting Departmemnts of electric utilities.—*A. M.*

Selling Electric Ventilation

Special Report, General Power Committee, Commercial and Industrial Power and Heating Bureau, Commercial National Section, N. E. L. A. Publication No. P-2, 20pp. (illustrated). Price, 50 cents; to members, 35 cents.

THIS is the second report of the "Marketing Electricity" series being published by the Commercial National Section. It calls attention to the vast possibilities of electric ventilation as a load builder and revenue producer for electric light and power companies. The report also is designed so as to be of service as a reference and guide in advising customers on the more simple types of installation.

The report is profusely illustrated and outlines a few of the many varied applications of electric ventilation to domestic, commercial and industrial users.—*E. S. B.*

Selling Wiring

Special Report, Wiring Sales Committee, Commercial National Section, N. E. L. A. Publication No. G-1, 24pp. (illustrated). Price, 50 cents; to members, 35 cents.

THIS report of the "Marketing Electricity" series deals with the work of the three divisions comprising the Wiring Sales Committee. On wiring promotion, a symposium is presented of the methods employed by a number of electric light and power companies toward promotion of adequate wiring. The plans followed by these various companies have been covered, such plans including the sales efforts, the financing scheme and advertising media. Brief reports on wiring materials and methods, and electrical code matters are included.—*E. S. B.*

Electrically Heated Stereotype Pots as Load Builders

Special Report, Industrial Heating Committee, Commercial and Industrial Power and Heating Bureau, Commercial National Section, N. E. L. A. Publication No. P-1, 16pp. (illustrated). Price, 40 cents; to members, 25 cents.

THIS is the first report of the "Marketing Electricity" series being published by the Commercial National Section. It discusses the application of electric heat to stereotype metal melting pots used by publishing companies, and the potential load. Statistics are presented showing that the public utility industry, by electrifying all the stereotype metal melting pots used by all newspapers of the country, could obtain an annual revenue of approximately $1,300,000. A load of such magnitude, with the desirable characteristics of unity power factor and high load factor, the report points out, is evidently of great value to electric light and power companies and should not be neglected.

A list is given of newspapers equipped with electric stereotype pots. Another table shows that plant demand is but slightly affected by electric stereotype pots. Operating data from representative large and small newspapers brings out the magnitude of the task which the heating equipment has to perform, and the relative economies of gas, oil and electrically heated stereotype pots.—*E. S. B.*

Construction and Maintenance Equipment and Methods

Report, Overhead Systems Committee, N. E. L. A. Publication No. 08, 20pp. (illustrated). Price, 40 cents; to members, 30 cents.

LABOR-SAVING devices, methods of construction and new equipment used for pole line construction and maintenance in the electric light and power industry are presented. A series of illustrations show more refinement in design for particular applications in truck work. The use of a narrow gage railway for construction of a tower line through swamp land and a blasting method of setting poles in boggy ground are described and illustrated.—*E. S. B.*

A Yardstick for Public Utility Costs

By William W. Handy, Consulting Engineer, Munsey Building, Baltimore, Maryland. Published by the Author. 155 pages. Illustrated with many charts and tables. Price $10.00.

THIS valuable reference book on the trend of costs of public utility construction and operation is the result of practical experience in the investigation of public utility properties covering the past two decades, and represents conclusions drawn from the detailed analyses of the operations of twenty representative gas and electric companies. The curves showing all the usual cost ratios and trends give maxima and minima and an overall average which provides what may quite properly be termed a public utility "yardstick" for the investigation of any particular electric light and power or gas property. It is expressly pointed out, however, that, as far as is now known, no comparable yardstick is possible for exclusively hydro-electric operations; a fact which is herewith commended to a considerable number of well-meaning gentlemen who advocate for this very purpose the establishment of water power plants under governmental auspices.

A feature of the book is the study covering trends in construction costs year by year since 1911. Except for a short peak in 1920 and a corresponding valley in 1921-1922, the figures show, in general, a gradual decline during the past ten years. They should make interesting reading to those who believe that the theory of "reproduction cost-new" will lead to an ultimate inflation of property values.—*W. M. C.*

$1,000 Prize for Advertising

(*Continued from page* 799)

fying from our standpoint and we feel that our customers and the sign industry have likewise received a proportional share of profit therefrom."

The Boston Edison Company's plan book, which ran to some 150 pages of amply illustrated material, gives the concrete picture of how a model campaign may be set up and executed by a large central station operating through an extensive territory. Divided into seven sections, the brochure discloses in its first section how the company organized to develop business. From there on, each section describes in detail, the beginnings and results of the annual sign show; how a continuous sign campaign is carried on and developed so as not to permit interest to flag; how electric shows may be transported to 26 outlying cities although the exhibits consist of elaborate sign displays; how sign schools are developed not only by a local central station, but with the cooperation of the N. E. L. A.; how to deal with reorganization of local sign groups who previously might have been under a loosely knit organization, etc.

The next award will be made in San Francisco in 1930 at the national convention of the N. E. L. A. Rules governing the award are as follows:

A. Only members of the National Electric Light Association are eligible to compete for the award.

B. The contribution to the industry may be in the form of a new use for electrical advertising; or it may be in the form of an identification program for a company's various properties. It may be in the form of an enterprise whereby businesses throughout the country, or in a particular locality, are brought to a keener realization of the value of electrical advertising; or it may be in the form of an activity which makes possible better merchandising of electrical advertising. Briefly, then, any activity that contributes to the advancement of the electrical advertising industry is eligible for consideration.

C. The gold medal will be presented to the Company, while the $1,000 will be awarded to the individual in the Company who is directly responsible for the activity which made possible the winning of the award.

Public Relations—Harry Reid, National Electric Power Co., New York, N. Y.

Geographic Division residents

Canadian—P. S. Gregory, The Shawinigan Water & Power Co., Montreal, Canada

Eastern—John F. Ford, Philadelphia Electric Co., Philadelphia, Pa.

East Central—L. B. Herrington, Kentucky Utilities Co., Louisville, Ky.

Great Lakes—G. C. Neff, Wisconsin Power & Light Co., Madison, Wis.

Middle West—A. E. Bettis, Kansas City Power & Light Co., Kansas City, Mo.

New England—C. H. Hodskinson, The Edison Electric Illuminating Co., Boston, Mass.

North Central—Thomas T. Parker, Northwestern Public Service Co., Huron, S. D.

Northwest—M. L. Hibbard, Idaho Power Co., Boise. Idaho

Pacific Coast—E. B. Criddle, Southern Sierras Power Co., Riverside, Cal.

Rocky Mountain—W. D. Johnston, Mountain States Power Co., Casper, Wyo.

Southeastern—T. H. Tutwiler. Memphis Power & Light Co., Memphis, Tenn.

Southwestern—Fred W. Insull, Public Service Co. of Oklahoma, Tulsa, Okla.

PUBLIC POLICY COMMITTEE

Chairman, P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Vice-Chairman, C. E. Groesbeck, Electric Bond & Share Co., New York, N. Y.

R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Henry G. Bradlee, Stone & Webster, Inc., Boston, Mass.

N. F. Brady, The New York Edison Co., New York, N. Y.

B. C. Cobb, Allied Power & Light Corp., New York, N. Y.

Frank L. Dame, The North America Co., New York, N. Y.

J. E. Davidson, Nebraska Power Co., Omaha, Neb.

Henry L. Doherty, Henry L. Doherty & Co., New York, N. Y.

Alex Dow, The Detroit Edison Co., Detroit, Mich.

Charles L. Edgar, The Edison Electric Illuminating Co., Boston, Mass.

Halford Erickson, Byllesby Engineering & Management Corp., Chicago, Ill.

W. W. Freeman, Columbia Gas & Electric Corp., New York, N. Y.

John F. Gilchrist, Commonwealth Edison Co., Chicago, Ill.

P. G. Gossler, Columbia Gas & Electric Corp., New York, N. Y.

A. R. Graustein, International Paper Co., New York, N. Y.

Franklin T. Griffith, Portland Electric Power Co., Portland, Ore.

Edwin Gruhl, The North American Co., New York, N. Y.

A. F. Hockenbeamer, Pacific Gas & Electric Co., San Francisco, Cal.

George H. Howard, The United Corp., New York, N. Y.

Martin J. Insull, Middle West Utilities Co., Chicago, Ill.

Samuel Insull, Commonwealth Edison Co., Chicago, Ill.

W. A. Jones, Cities Service Co., New York, N. Y.

Thomas W. Martin, Alabama Power Co., Birmingham, Ala.

Thomas N. McCarter, Public Service Electric & Gas Co., Newark, N. J.

John B. Miller, Southern California Edison Co., Los Angeles, Cal.

Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

J. J. O'Brien, H. M. Byllesby & Co., Chicago, Ill.

J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. Pack, Northern States Power Co., Minneapolis, Minn.

A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

H. T. Sands, Electric Bond & Share Co., New York, N. Y.

Paul A. Schoellkopf, The Niagara Falls Power Co., Buffalo, N. Y.

M. S. Sloan, The New York Edison Co., New York, N. Y.

Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

R. P. Stevens, Allied Power & Light Corp., New York, N. Y.

Frank M. Tait, The Dayton Power & Light Co., Dayton, Ohio

George N. Tidd, American Gas & Electric Co., New York, N. Y.

Herbert A. Wagner, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

Owen D. Young, General Electric Co., New York, N. Y.

John E. Zimmermann, The United Gas Improvement Co., Philadelphia, Pa.

Public Relations National Section Representatives

D. C. Green, Electric Bond & Share Co., New York, N. Y.

T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

Harry Reid, National Electric Power Co., New York, N. Y.

Guy W. Talbot, Pacific Power & Light Co., Portland, Ore.

GEOGRAPHIC DIVISIONS STATE ASSOCIATIONS

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association
President, P. S. Gregory, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary*, H. M. Lyster, Room 405, Power Bldg., Montreal, Can.

(*This Division Has No State* [*Provincial*] *Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, John F. Ford, Philadelphia Electric Co., Philadelphia, Pa.; *Managing Director*, A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association
President, William R. Welsh, New York & Richmond Gas Co., Stapleton, S. I., N. Y.; *Secretary*, Charles H. B. Chapin, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association
President, C. H. Howell, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary*, S. F. Delany, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association
President, John F. Ford, Philadelphia Electric Co., Philadelphia, Pa.; *Managing Director*, A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, L. B. Herrington, Kentucky Utilities Co., Louisville, Ky.; *Secretary-Treasurer*, D. L. Gaskill, 603 Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities
President, Samuel Riddle, Louisville Railway Co., Louisville, Ky.; *Secretary*, E. F. Kelley, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia
President, A. C. Spurr, Wheeling Traction Co., Wheeling, W. Va.; *Secretary*, A. Bliss McCrum, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, G. C. Neff, Wisconsin Power & Light Co., Madison, Wis.; *Secretary*, Tom C. Polk, 26 North Wacker Drive, Chicago, Ill.

Illinois State Electric Association
President, E. F. Kelly, Central Illinois Public Service Co., Springfield, Ill.; *Secretary-Treasurer*, George W. Schwaner, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association
President, C. V. Sorenson, Central Indiana Power Co., Indianapolis, Ind.; *Secretary-Treasurer*, William Stokes, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section
President, E. L. Edward, Michigan Electric Power Co., Lapeer, Mich.; *Secretary-Treasurer*, Herbert Silvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association
President, G. W. Van Derzee, Milwaukee Electric Railway & Light Co., Milwaukee, Wis.; *Executive Secretary*, John N. Cadby, 502 Brumder Bldg., 105 Wells St., Milwaukee,, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association
President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary*, D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia
President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary*, A. B. Tunis, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, A. E. Bettis, Kansas City Power & Light Co., Kansas City, Mo.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. Macy, Iowa Power & Light Co., Adel, Iowa; *Managing Director,* Joe Carmichael, 310 Crocker Bldg., Des Moines, Iowa.

Kansas Section

President, Frank M. Stone, Kansas Utilities Co., Fort Scott, Kan.; *Secretary,* H. Lee Jones, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, T. J. Strickler, Kansas City Gas Co., Kansas City, Mo.; *Secretary-Treasurer,* F. D. Beardslee, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. Amidon, Central Power Co., Grand Island, Neb.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, C. H. Hodskinson, The Edison Electric Illuminating Co., Boston, Mass.; *Secretary,* Miss O. A. Bursiel, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, Thomas T. Parker, Northwestern Public Service Co., Huron, S. D.; *Secretary,* John W. Lapham, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah. Washington)

Northwest Electric Light and Power Association

President, M. L. Hibbard, Idaho Power Co., Boise, Idaho; *Secretary,* Berkeley Snow, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, E. B. Criddle, Southern Sierras Power Co., Riverside, Cal.; *Secretary,* Samuel H. Taylor, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. Pooler, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary,* L. C. McCullough, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, W. D. Johnston, Mountain States Power Co., Casper, Wyo.; *Secretary,* O. A. Weller, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, H. S. Robertson, Denver Tramway Corp., Denver, Colo.; *Secretary,* O. A. Weller, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. Nielsen, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer,* Bernard L. Wiles, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. Johnstone, Mountain States Power Co., Casper, Wyo.; *Secretary,* F. A. Probst, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, T. H. Tutwiler, Memphis Power & Light Co., Memphis, Tenn.; *Secretary,* C. M. Kilian, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, Fred W. Insull, Public Service Co. of Oklahoma, Tulsa, Okla.; *Secretary,* S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. Bann, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary,* R. I. Brown, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. Jones, Jones-Johnson Co., McComb, Miss.; *Secretary,* A. R. Riddick, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, Thomas R. Weymouth, Oklahoma Natural Gas Corp., Tulsa, Okla.; *Secretary,* Edward F. McKay, 1020 Petroleum Bldg., Oklahoma City, Oyla.

Southwestern Public Service Association

President, Knox Lee, Southwestern Gas & Electric Co., Marshall, Tex.; *Secretary,* E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Charles A. Coffin Prize Committee—M. S. Sloan, The New York Edison Co., New York, N. Y.

Codes and Standards Committee—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—Britton I. Budd, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. Goldschmidt, Wagner Electric Corp., New York, N. Y.

Finance Committee—Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. Onken, Jr., *Electrical World,* New York, N. Y.

Public Policy Committee—P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Rate Research Committee—L. R. Nash, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—Paul A. Schoellkopf, The Niagara Falls Power Co., Buffalo, N. Y.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—John B. Reynolds, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—Fred R. Jenkins, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. Sawyer, Stevens & Wood, Inc., New York, N. Y.

***Membership Committee**—A. Jackson Marshall, National Electric Light Association, New York, N. Y.

***Rural Electric Service Committee**—Eugene Holcomb, Consumers Power Co., Jackson, Mich.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—W. R. Emerson, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Budget Committee**—B. F. Rodey, The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. Hasbrouck, H. C. Hopson & Co., New York, N. Y.

***Customers' Records Committee**—E. W. Korsmeyer, Henry L. Doherty & Co., New York, N. Y.

Exhibit Committee—T. A. Wallace, Henry L. Doherty & Co., New York, N. Y.

***Fixed Capital Committee**—Thomas M. Ford, Philadelphia Electric Co., Philadelphia, Pa.

***General Records Committee**—C. E. McBride, Electric Bond & Share Co, New York, N. Y.

***Purchasing and Storeroom Committee**—K. C. Campbell, The Detroit Edison Co., Detroit, Mich.

***Statistics Committee**—Harry A. Snow, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

***Section's Executive Committee**—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. Tallman, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. Wilhelmy, The Union Gas & Electric Co., Cincinnati, Ohio

General Power Committee—H. C. Thuerk, Associated Gas & Electric System, New York, N. Y.

Industrial Heating Committee—J. L. Faden, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—M. E. Skinner, New York Power & Light Corp., Albany, N. Y.

Commercial and Industrial Lighting Committee W. H. Horton, Jr., West Penn Power Co., Pittsburgh, Pa.

Electrical Advertising Committee—C. J. Eaton, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. Blackwell, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. Malcomson, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—Frank D. Pembleton, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—Frank A. Coupal, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. Harold, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. Dunn, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—Norman T. Wilcox, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. East, Public Service Co. of Northern Illinois, Chicago, Ill.

***Wiring Sales Committee**—A. P. Good, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—A. D. Bailey, Commonwealth Edison Co., Chicago, Ill.

***Accident Prevention Committee**—C. R. Beardsley, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—R. A. Hentz, Philadelphia Electric Co., Philadelphia, Pa.

Engineering Administration Committee—W. E. Mitchell, Georgia Power Co., Atlanta, Ga.

Engineering Research Committee—C. F. Hirshfeld, The Detroit Edison Co., Detroit, Mich.

***Hydraulic Power Committee**—Byron E. White, Utica Gas & Electric Co, Utica, N. Y.

***Inductive Coordination Committee**—H. L. Wills, Georgia Power Co, Atlanta, Ga.

***Meter Committee**—A. S. Albright, The Detroit Edison Co, Detroit, Mich.

***Overhead Systems Committee**—Sydney Alling, Rochester Gas & Electric Corp., Rochester, N. Y.

***Power System Engineering Committee**—L. W. W. Morrow, *Electrical World,* New York, N. Y.

***Prime Movers Committee**—R. D. DeWolf, Rochester Gas & Electric Corp., Rochester, N. Y.

***Underground Systems Committee**—G. C. McCabe, The Detroit Edison Co., Detroit, Mich.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—HARRY REID, National Electric Power Co., New York, N. Y.

***Cooperation with Educational Institutions**—JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

***Cooperative Advertising and Publicity Committee**—JOHN P. COGHLAN, Pacific Gas & Electric Co., San Francisco, Cal.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

Manufacturers' Advertising Committee—(To be determined.)

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—CHARLES B. STUART, Halsey Stuart & Co., New York, N. Y.

***Women's Committee**—MISS SARA HARRIS, Utica Gas & Electric Co., Utica, N. Y.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

December

2–4 Conference of Utility Association Secretaries, Drake Hotel, Chicago, Ill.

2–4 *American Institute of Electrical Engineers, Regional meeting, Chicago, Ill.*

2–6 *American Institute of Mechanical Engineers, Annual meeting, New York, N. Y.*

4–7 *American Society of Refrigerating Engineers, New York, N. Y.*

4–7 *The American Mining Congress, Mayflower Hotel, Washington, D. C.*

5–6 The Empire State Gas and Electric Association, Electric Section, Briarcliff, N. Y.

10–11 Commercial and Industrial Power and Heating Bureau, Commercial National Section, Westinghouse Lighting Institute, Grand Central Palace, New York, N. Y.

12 *New York Electrical Society, 29 West 39th Street, New York, N. Y.*

13 *Board of Directors, Society for Electrical Development, New York, N. Y.*

16 Accounting Section, Great Lakes Division, Palmer House, Chicago, Ill.

January

9–11 *American Engineering Council, Washington, D. C.*

13–14 Accident Prevention Committee, N. E. L. A. Headquarters, 420 Lexington Ave., New York, N. Y.

16–17 Lighting Bureau Committees, Hotel Schenley, Pittsburgh, Pa.

20–21 North Central Electric Association, Commercial Section, St. Paul Hotel, St. Paul, Minn. (Attendance by invitation only.)

20–22 Great Lakes Division, Commercial Section, Edgewater Beach Hotel, Chicago, Ill.

21–22 Underground Systems Committee, Washington, D. C.

23 Commercial National Section, Executive Committee, Edison Bldg., Chicago, Ill.

23–24 Overhead Systems Committee, Baltimore, Md.

24–25 Electrical Apparatus Committee, Commodore Hotel, New York, N. Y.

27–29 *American Society of Heating and Ventilating Engineers, Philadelphia, Pa.*

27–31 *American Institute of Electrical Engineers, New York, N. Y.*

27–31 *American Institute of Electrical Engineers, Santa Monica, Cal.*

27–31 *American Institute of Mining and Metallurgical Engineers, New York, N. Y.*

February

24–25 Accounting National Section Group Committee Meetings, Book Cadillac Hotel, Detroit, Mich.

24–25 North Central Electric Association, Engineering Section, Nicollet Hotel, Minneapolis, Minn.

24–25 Accounting National Section, Group Committee meetings, Book Cadillac Hotel, Detroit, Mich.

March

10–13 Engineering National Section, Group Committee Meetings, Edgewater Beach Hotel, Chicago, Ill.

11–13 Oklahoma Utilities Association, Tulsa, Okla.

April

5–9 *American Society of Mechanical Engineers, Washington, D. C.*

15–17 Southeastern Geographic Division, Bon Air-Vanderbilt Hotel, Augusta, Ga.

23–25 Middle West Division, Fort Des Moines Hotel, Des Moines, Iowa.

28–30 *Chamber of Commerce of U. S. A., Washington, D. C.*

May

1–2 *Chamber of Commerce of U. S. A., Washington, D. C.*

12–16 *National Fire Protection Association, Atlantic City, N. J.*

25–29 *Advertising Federation of America, Boston, Mass.*

June

9–12 *The American Society of Mechanical Engineers, Detroit, Mich.*

11–12 North Central Electric Association, Managerial, Alex Johnson Hotel, Rapid City, S. D.

16–20 NATIONAL ELECTRIC LIGHT ASSOCIATION, EXPOSITION AUDITORIUM, SAN FRANCISCO, CAL.

16–25 *World Power Conference, Berlin, Germany.*

21–26 *American Electric Railway Association, San Francisco, Cal.*

23–27 *American Institute of Electrical Engineers, Toronto, Can.*

September

25–27 Great Lakes Geographic Division, French Lick Springs, Ind.

NEW MEMBERS

Light and Power Companies, Employees of Light and Power Companies, Invited Persons, Manufacturing Companies, Employees of Manufacturing Companies, Associated Companies, Employees of Associated Companies and Foreign Organizations who have recently become Members of the National Electric Light Association.

NOTE: Names of new individual members are shown in the following order: First, in italics, post office address of company employing new members, and on the same line, in Roman letters, the name of the company employing new members; on succeeding indented lines, names of new members followed by post office address.

Electric Light and Power Companies (Class A)

Kansas, Abilene, The Central Kansas Power Company
Maine, Presque Isle, Maine Public Service Company

Employees of Electric Light and Power Companies (Class B)

Alabama, Birmingham, Alabama Power Company
    R. L. Harris
Alabama, Birmingham, Southeastern Power & Light Corp.
    S. D. Summers
California, Fresno, San Joaquin Light & Power Corp.
    Mrs. Mabell E. Tripp
    Miss Clyda E. Weems
California, Los Angeles, Southern California Edison Company
    W. C. Curl
    J. F. Davenport
    Dwight P. Merrill (Redlands, Cal.)
    Harold Michener (Pasadena)
    Mrs. Jeanette I. Rees
    D. C. Tandy
California, San Diego, San Diego Consolidated Gas & Electric Company
    G. D. Brown
    William E. Frazer
    Roy E. Fritzer
    F. M. Sherrill
    F. A. Westrick
California, San Francisco, Pacific Gas & Electric Company
    W. R. Bowler (San Jose)
    J. B. Moorhead (Marysville)
Connecticut, Hartford, The Hartford Electric Light Company
    Miss Erna Fisher
Indiana, Indianapolis, Indiana Public Utilities Association
    H. E. Jordan
Maine, Portland, Cumberland County Power & Light Company
    Edwin T. Emerson
Massachusetts, Boston, The Edison Electric Illuminating Co. of Boston
    Miss Marjorie Howarth (Roslindale)
    Miss Clara A. Robinson
Massachusetts, Boston, New England Power Company
    Francis Lorenze Rimbach (Worcester)
Massachusetts, Boston, Charles H. Tenney & Company
    Eben B. Haskell
Massachusetts, Boston, The Twin States Gas & Electric Company
    Milton Harrison Worden
Massachusetts, Worcester, The Worcester Electric Light Company
    Earl C. Hart
Mississippi, Gulfport, Mississippi Power Company
    Dave Cottrell
Montana, Great Falls, Great Northern Utilities Company
    R. O. McPhillips (Shelby)
New Jersey, Newark, Public Service Electric & Gas Company
    Clyde D. Deitzler (Paterson)
    Albert J. Kahny (Princeton)
    Wilbur M. McFeely (Lansdowne, Pa.)
    Will McLain (Orange)
    John Schechel (Union City)
    Albert M. Wert (Princeton)
    Elmer E. Wyckoff, Jr. (East Orange)
New York, New York, American Gas & Electric Company
    H. O. Reinhardt
New York, New York, The New York Edison Company
    Lawrence Brieger
    David F. Bulson (Jackson Heights, L. I.)
    John A. Devitto
    Franklin L. Harris (Bayside)
    William J. Healy
    Louis G. Herz, Jr.
    Edwin A. Mellin
    C. Moyle Mosher (Brooklyn, N. Y.)
    Nicholas F. Ritter
    Joseph Francis Williams

INFORMATIONAL LITERATURE

(Prices do not include transportation.)

289-07—Edison: The Boy—The Man. By Ernest Greenwood.

Paper Covered Edition

1-100	copies, per C	$20.00
101-500	copies, per C	19.00
501-1000	copies, per C	18.00
Over 1000	copies, per C	17.00

Cloth Bound Edition

1-100	copies, per C	$23.00
101-500	copies, per C	22.00
501-1000	copies, per C	21.00
Over 1000	copies, per C	20.00

289-88—Factors in the Progress of a Great Industry. By P. S. Clapp. $2.50 per 100.

289-89—The Cooperative Work of the National Electric Light Association. By P. S. Arkwright. $3.75 per 100.

289-91—Public Policy Committee Report. By R. H. Ballard, Chairman. $3.00 per 100.

289-94—Sales Increase or Rate Increase? By M. S. Sloan. $2.50 per 100.

289-96—Super Humans for Better Institutions. By J. F. Gilchrist. $3.75 per 100.

289-97—This Half Century of Unparalleled Advancement. By J. H. Barnes. $3.75 per 100.

289-99—The Electrical Industry and Its Public Relations. By J. F. Owens. $3.75 per 100.

289-101—Practical and Economic Aspects of Standardization. By L. L. Elden. $3.00 per 100.

289-102—Science and Progress in the Industries. By J. J. Carty. $3.00 per 100.

289-103—The Professional Motive in Public Utility Management. By D. W. Malott. $3.00 per 100.

289-104—The Customer's Side of the Meter. By A. W. Robertson. $2.50 per 100.

289-105—The Part Electricity Can Play in Better Home Management. By Lita Bane. $3.00 per 100.

289-106—Public Utility Regulation and Its Accomplishments. By William J. Hagenah. $5.50 per 100.

289-107—Industrial Development in the United States and Canada—1927 and 1928. By J. L. Madden. $3.75 per 100.

289-109—The Trend of the Times. By David Lawrence. $3.00 per 100.

289-110—The Public Right as to Electric Rates. By W. L. Ransom. $3.75 per 100.

289-113—The Superiority of Private Enterprise. By Sir Ernest J. P. Benn, Bt. $12.50 per 100.

289-120—Status of Railroad Electrification. By Britton I. Budd and George Gibbs. $4.50 per 100.

Edison Day Addresses—45c. per copy up to 99; 40c. per copy 100 and over.

289-14—The Electric Light and Power Industry in the United States. Paper binding, 1 to 25 copies, $1.00 each; 26 to 100 copies, 90c. each; 101 to 500 copies, 85c. each; 501 or more, 75c. each.

289-3 —N.E.L.A. Handbook. Compiled by Public Speaking Committee. $2.50 per copy.

289-13—Government (Political) Ownership and Operation and the Electric Light and Power Industry. 1 to 10—$1.50 per copy; 11 to 25—$1.40 per copy; 26 to 100—$1.30 per copy; 101 or more—$1.25 per copy.

289-35—Interconnection. By George N. Tidd. $3.75 per 100.

289-30—Street Railways. By A. W. Robertson. $3.75 per 100.

289-29—The Gas Industry. By B. J. Mullaney. $3.75 per 100.

289-31—Financing the Utilities. By Martin J. Insull. $3.75 per 100.

289-32—Fallacies With Regard to the Utilities. By H. T. Sands. $3.75 per 100.

289-33—Holding and Management Companies. By Halford Erickson. $12.00 per 100.

289-34—State Regulation of Public Utilities. By Wm. J. Hagenah. $9.50 per 100.

289-36—Public Utility Information Bureaus. By H. M. Lytle. $6.50 per 100.

289-54—Water Power—Neither Bonanza Nor Gold Brick. By F. A. Annett. $3.50 per 100.

289-51—Thomas A. Edison Smashes the Hydro-Electric Power Illusion. $3.50 per 100.

Public vs. Private Ownership and Operation of Water Power Resources. By Hugh L. Cooper. $7.50 per 100.

WOMEN'S COMMITTEE PUBLICATIONS

278-26—Light and Power for the Homemaker. By Mrs. Anna Steese Richardson. $4.00 per 100.

Electricity and the Women of America. By Miss Sophia Malicki. 10c. each.

The Home Service Department. No charge.

More Power to the Home! Series.

1. **Wiring the House**—1-9..10c. each; 10 and over 9c. each.
2. **Light—the First Home Builder; Better Lighting**—1-9..15c. each; 10 and over 14c. each.
3. **Washing** ....—1-9..10c. each; 10 and over 9c. each.
4. **Ironing** ....—1-9..12c. each; 10 and over 11c. each.
5. **Many Motors Make Light Work**—1-9 15c. each; 10 and over 14c. each.
6. **Electric Range Cookery**—1-9..15c. each; 10 and over 14c. each.
7. **Cooking With Small Electrical Appliances**—1-9..13c. each; 10 and over 12c. each.
8. **Electric Refrigeration**—1-9..14c. each; 10 and over 13c. each.

OTHER PUBLICATIONS

(Prices include transportation in United States only.)

ACCIDENT PREVENTION—RESUSCITATION

Resuscitation in Gas Poisoning, Electric Shock and Drowning. Booklet 3¼x6 inches. 20 pages. 3 illustrations. (Publication No. 289-70).

1-9	copies, to one address, each	.10
10-99	copies, to one address, each	.08
100-499	copies, to one address, each	.06
500-999	copies, to one address, each	.04
1000-2499	copies, to one address, each	.03
2500-9999	copies, per M	$20.00
10,000-24,999	copies, per M	19.00
25,000-49,999	copies, per M	18.00
50,000-99,999	copies, per M	17.00
100,000 and over,	per M	16.00

Accident Prevention Course for Linemen.

	Price	To Members
1-24 copies	.25	.16
25 copies to one address, each	.22	.15
100 copies to one address, each	.21	.14
250 copies to one address, each	.20	.13
500 copies to one address, each	.19	.12

ENGINEERING REFERENCE WORKS

Handbook for Electrical Metermen, 1924. Fourth Edition. Publication No. 24-31. 4½ by 6¾ inches. 1242 pages. Bible paper.

	Price	To Members
1-9 copies	$6.00	$4.00
10 copies to one address, each	5.65	3.75
25 copies to one address, each	5.25	3.50
50 copies to one address, each	4.90	3.25
100 copies to one address, each	4.50	3.00

Relay Handbook, 1926. Publication No. 25-3. 4½ x 6¾ inches. 1024 pages. Bible paper.

	Price	To Members
1-9 copies	$6.00	$4.00
10 copies to one address, each	5.65	3.75
25 copies to one address, each	5.25	3.50
50 copies to one address, each	4.90	3.25
100 copies to one address, each	4.50	3.00

Overhead Systems Reference Book, 1927. Publication No. 267-5. 8½ x 11¼ inches. 592 pages.

	Price	To Members
1-9 copies	$7.50	$5.00
10 copies to one address, each	7.25	4.75
25 copies to one address, each	7.00	4.50
50 copies to one address, each	6.75	4.25
100 copies to one address, each	6.50	4.00

Code for Electricity Meters. 3rd Edition. Publication No. 267-70. 6x9 inches, 132 pages,

1-9 copies	$2.00
10 copies to one address, each	1.90
25 copies to one address, each	1.80
50 copies to one address, each	1.70

PERIODICALS

Rate Research. A weekly digest of court opinions and commission decisions affecting the central station industry. Per year, $10. Foreign, $11.

N.E.L.A. Bulletin. $3 per Year; $4 Foreign.

PROCEEDINGS

	Price	To Members
N.E.L.A. Proceedings. 1927-1928	$15.00	$10.00

RATES

N.E.L.A. Rate Book (1929 edition). Rates effective up to May 1st reported for all cities in U. S. and Canada of 20,000 population and over; also includes an Appendix of approximately 200 U. S. cities under 20,000 population. Price, $10.00 members; $25.00 non-members.

Member prices to A.I.E.E. members.

Reduced prices for quantities apply only to one order in one shipment to one address and are not cumulative. Quantity prices, where not stated, furnished on request. Half prices to colleges and public libraries upon direct order to the Association. Discount of 15 per cent from non-member prices allowed to dealers. Organizations should send orders on their purchase forms. Please give publication number, when shown.

REPORTS
EDITORIAL DEPARTMENT

Binders *for* N.E.L.A. Publications

The Association offers for sale leatherette binders for those of its publications that appear periodically or in series. These binders are priced as follows:

N. E. L. A. Bulletin	1.75
Rate Research	1.25
Weekly Information Letter	1.25
Electrical News Items	1.25
Statistical Reports	1.25
Public Opinion	1.25
Informational Booklets	1.25

For Reports:	
Engineering Reports (Large size binder)	1.75
Engineering Reports	1.25
Accounting Reports	1.25
Commercial Reports	1.25
Public Relations Reports	1.25
General and Special Committees	1.25

A Complete Set of 12 Binders May Be Purchased for $15

The Executive's Collection

(Service A) Entire Collection—*consisting of publications of the Association for the current year to be mailed to subscribers as issued, with loose leaf binders for publications requiring them, and the Association's Standard Reference books.*

Includes:

1 copy Proceedings of the Association
1 year's subscription to N. E. L. A. Bulletin
1 copy, current year's edition, Political Ownership and the Electric Light and Power Industry
All Serial and other reports of the Association
All informational booklets of the Association
1 copy Overhead Systems Reference Book
1 copy Handbook for Electrical Metermen
1 year's subscription to Rate Research
1 copy N. E. L. A. Handbook
1 copy Relay Handbook
1 Code for Electricity Meters

Subscription Price—$60.00

(Service B)—Same as Service A with exception of last four items

Subscription Price—$48.00

When ordering specify which service is desired and what month to begin sending periodical publications.

To chief executives, managers, department heads, librarians, statisticians, editors, and others who have need for a complete, easily accessible reference set of the publications of the Association, the service offered in *The Executive's Collection* of N.E.L.A. publications is recommended.
